Let me just qualify this some more...

After the incident, two of the SO radio shop employees
went out to the site, and were able to hit numerous
2 meter repeaters, including very busy machines, with
their radios (They are hams).
The frequency the HAM used to notify people was
the administrative frequency for the Sheriffs Department.

And it was his friends ankle, not his leg.

Sorry for the (slight) misinformation. The point I failed to make
is, that one needs to be sure what constitutes an emergency, before
one decides to use that as an excuse to broadcast.

10929. Emergency Transmissions

Yahoo group: GMRS (2005 — 2007)
Date: 2006-02-28 19:38:34 UTC
From: Lake Hodges Radio
Topic: 10889 Message: 10929

At 11:08 AM 2/28/2006, Blake Bowers wrote:
They did NOT arrest him, however they did call him in for
a meeting afterwards, at which time in order to preclude
prosecution he turned over his radio to the FCC.
==========

Maybe you are referring to a different incident, but if you're
talking about the guy in San Diego County a few years ago, I heard
that the local police initially confiscated his radio, then gave it
back to him a few days or weeks later.

No action was taken by the FCC.

Some people have interpreted Part S 97.111 (a) (2) to allow him to do
what he did, as long as he did not interfere or impede the police
department's use of that frequency. Similar life and death
transmissions have been made on the 121.5 MHz international aviation
distress frequency. When a life and death emergency is legitimate,
the FCC doesn't seem to take any action against these people.

See below.

S 97.111 Authorized transmissions.
(a) An amateur station may transmit the following types of two-way
communications:
(2) Transmissions necessary to exchange messages with a station in
another FCC-regulated service while providing emergency communications

Wait a minute these are TWO TOTALLY DIFFERENT ISSUES PLEASE DON'T CONFUSE THEM. The original
question was if someone could "announce" there's severe weather coming! I said YES and the subject changed into emergency calling procedures. What's the problem here?

> Definition of broadcast one-way communication and not allowing any
> other station to transmit!
>
> ANNOUCING SEVERE WEATHER FALLS UNDER AN EMERGENCY THEREFOR
> PERFECTLY LEGIT!

Not really. Severe weather does not in and of itself constitute a condition "concerning the immediate protection of property or the safety of someone's life", which is the true definition of an emergency. I have heard many a weather warning. None of these warnings destroyed my house or my life.

Now... if you happen to see an active tornado barreling down on you, that would constitute *immediate* danger. I would imagine this constitutes a valid "emergency".

People tend to regard emergencies as something other than what the actual definition is. You have to have that *immediate* threat there. No "maybe sorta kinda" stuff. It has to be there in your face happening now.

Being in a murder-prone area, and being scared, is not an emergency. Being shot is.

>Take the word
> "broadcast" out of there, he's not "broadcasting". He's announcing

> the air.

That is a broadcast. A one-way transmission not intended to receive a response. Announcement-Broadcast. Same thing.

>Are you guys saying I can't go on FRS1 and say there's
> serve weather coming?

That is evidently what we are saying. FRS and GMRS are services to facilitate *two way* communications. Any transmissions not intended for two way communications are considered broadcasts, and as such are not listed under permissible communications.

I was wrong.

On the GMRS 'interstitial' frequencies, one way pages are prohibited

95.27 (f) 2

My error.
I was reading from the 'permissible communications' from 95.181 (h).

Nope, it was in a later meeting, with the local EIC from the
FCC, and the Sheriffs department. Per the FCC
EIC, who has since retired and is in private consulting
practice.

People can try to interpet part S 97.111 to cover this,
but the fact remained that the persons life was not in
danger, and they proved that other means of communications
were available.

From: David W Proshek
Topic: 10936 Message: 10936

Thanks again everyone for your input on my question. Since there was a large diversity among the respones, I have gone to the horses mouth (or rear end) depending on how you look at it. I have contacted the FCC by email with a detailed description of what I would like to do. I will await their response (I wont hold my breath). I will inform the group of what "Uncle Charlie" determines. I see that my question has caused quite a stir among the group, and my intention was not to cause such an uproar. But thank you all for your time, and I appreciate all your comments and replies.

Just with some of the enforcement players involved.

Turns out, there was a bit of an uproar, I think the
boy was even given his radio back through the SO,
but only after promises not to go out of band again.

The power of politics.

John,

You are a real diplomat. You are much more of a diplomat than I am. But all your logic is for naught. He didn't like the current flow of opinion and has gone to the FCC hoping to get a more favorable answer to what he wants to do.

I hope he gets the correct answer the first time, rather than the second (as he gets warned or cited).

I'm thinking of the email answer GMRSlinking got when they asked by email if what they were doing was okay. Then the warning letter they got later.

RIP gmrslinking.com

Hi David,

I noticed that the GMRS forum has a copy of the FCC part 95 rules in the files area. You may want to download it and read it for yourself. I don't want to beat a dead horse, but I think you will find in 95.27(f), what you want to know.

10942. Part 95 Rules and Regs

Yahoo group: GMRS (2005 — 2007)
Date: 2006-03-01 08:28:12 UTC
From: kvsp1160@aol.com
Topic: 10942 Message: 10942

Hi everyone,

Here's a simple way to look up the Part 95 Rules and Regulations via the FCC. This covers GMRS, FRS, CB, and other services within the FCC Wireless Telecommunications Bureau:

http://www.access.gpo.gov/nara/cfr/waisidx_05/47cfr95_05.html

It's the most recent one that the FCC has online, direct from the Wireless Telecommunications Bureau. I have a direct bookmark to this website.

Every question that you ask and I have answered, I get my answers from here first. I don't second guess. And if I'm corrected, it's either from an update of rules or a mixup/error of typing.

73,
Ryan

> wants to do.
>
Honestly, that may be the best course of action. Interpretations
differ among everyone. GMRS needs more plain english explanations in
its regs.

I figured he left because there was so much offtopic chatter about
things like people getting busted for transmitting on emergency
frequencies that what he wanted to know was lost in the noise.

> I hope he gets the correct answer the first time, rather than the
> second (as he gets warned or cited).
>
I thought that I had given him a perfectly legal way to announce the
weather alerts by making them a 2-way conversation e.g.

Person 1) This is Wxxxnnn with severe weather information for the
Oakhill subdivision. Is anyone listening? Over.

Person 2) This is Wzzzmmm. What is the severe weather infomation?

etc.

10946. radio regulations for GMRS

Greetings...

I find this kind interesting....

During the 60's and 70's, as cb was growing up, there seemed to be very little interest in 'playing by the rules'....

Now, with gmrs you seem very 'rules oriented'....I hope this is a sign of better things to come for 'gmrs'....

==========

Larry,

My experience is this... In the 60s and 70s when CB renegades broke the rules, they could get 20-30 miles range with 5 watts and a ground plane and work cross-country skip with a linear amp. The propagation characteristics of 11 meters permits that.

So it SEEMED like there were more scofflaws because they could be heard far away.

Today... there are something like 15 million little FRS/GMRS radios sold each year. About one out of 500,000 bothers getting a license. For all I know, there may be 20 million people using GMRS radios (on channels 15 to 22) illegally without a license.

The major difference is that with the low power output and low gain antennas and 38 privacy codes (CTCSS tones) per channel on line-of-sight UHF frequencies and the resulting limited range (usually less than 10 miles, and even less than a mile in most cases) keeps the signals isolated so that you don't hear as many people as you did on 11 meters.

FRS/GMRS is no more rules-oriented than CB was during its day. With a very small number of exceptions (such as the people in this Yahoo Group), most FRS/GMRS users are much the same as the CB renegades of the past, but without the range (distance) capabilities.

Plus --- maybe kids lose interest faster in FRS and GMRS than they did in the CB heydays. If no one hears them and no one responds, they give up and go play with their video games instead.

I once drove up to a view point near Lake Arrowhead, 4,000 feet above the LA basin with a clear 70-mile view from the Palm Springs Desert to the Ocean and Catalina Island. I have a GMRS rig with a gain antenna in my car.

Trust me when I say that FRS/GMRS are just as bad as CB ever was.

You just can't hear people on UHF more than a few miles away, UNLESS you're up high with a good receiver and good antenna.

Yes... there ARE professional, ethical GMRS users who play by the rules, and (thankfully) those are the guys with the 50 watt rigs and gain antennas.

10950. Re: [GMRS] radio regulations for GMRS

Yahoo group: GMRS (2005 — 2007)
Date: 2006-03-02 11:11:51 UTC
From: kvsp1160@aol.com
Topic: 10946 Message: 10950

Hi Larry,

I'm sure I'm opening a can of worms here, but there are lots of repeater owners like myself, as well as group organizations and the such who rely just on GMRS only. Amateur radio and the Citizens Band are still there and in most areas, CB is still somewhat helpful, but GMRS is starting to become like another CB service. So we have to keep mantaining our service as agroup and as individuals who paid a whopping $75-80 for a license, and we don't want it to go down the drain.

It's not really too fair that the ARS (hams) have their own system and are watched closely by the FCC and other groups so they don't get out of hand, but most folks within the FCC don't even know what the GMRS is or what the rules are... Sad huh?

So we have to help the new guys with their licensing, and finding the correct radio, and anyswering their questions, and help them build and setup their station and repeater system. Almost like the ARS does, but we do it as a team and as a family, whether we realize it or not.

We argue and fight over stupid questions, when the answer has already been answered, and we also agree on alot of things as well. And when another GMRS user is in need of equipment or is hurt from a storm or has been damaged, we chip in and help them for free. Why? Because we're a family and that's what we do.

So, in all honesty, if we didn't uphold the rules and regs of Part 95 and let all hell brake loose, this group wouldn't exist, I wouldn't have met you, I'm sure the ARRL wouldn't care too much for the ARS in the first place, and the folks on the FRS/GMRS packs would be on their radios without a license.

I think I'm at least thankful for those who get on my case about a rule here and there. It hels me to be alert and to sharpen my knowledge in this service. It also helps me and others to work on and become better with our communication skills as well.

So a big 73! to the group and everyone involved in the GMRS community. Thanks for everything! We all appreciate your hard work and involvement that you do, even when no one notices.

From: Chris Catotti
Topic: 10952 Message: 10952

This year I should have a GMRS repeater up and running in our community. Our family has permission to use two different repeaters in nearby counties. Each family member has an Icom IC-F21GM walkie talkie.

I am seeking a recommendation for mobile radios (25-50 watts) that allow the squelch tones to easily be changed without the use of a programmer or special interface cable. This would be for use in our cars, and on for the home.

Any recommendations?

What I find interesting, Oh and Ryan great post, this is exactly how CB was in the 60's and early 70's. The license cost, people cared. In fact in the small mountain community I grew up in, east of Ryan a couple hundred miles, many folks used it as primary communications. Folks often lived where phone service was barely or not in place. Quite often going down leaving CB as the only way to get help. All the sheriffs had it, you could get the sheriff or ambulance on CB. Sadly we all know what happened to CB. But even at that it is not all bad everywhere. Also as sad as it may be, much as we try GMRS is detain to befall the same fate. Just follow the money and see. CB went down hill when the market was flooded with low cost equipment. If they would have had bubble packs then it would be the same story.

All we can do is hold on be helpful and sadly put up with the problems until like with CB it settles down. My base has just this last week pretty much quieted down from the Christmas bubble pack stampede! I guess the kids are tired of them or they finial broke or won't keep a charge. So now it will be quite till next Christmas.

If you do not wish to get a license, then you may only operate on
channels 7-14. To legally operate on any other frequency, you require
a license.

Welcome to the mess created by the FCC and big business :(

I don't think the fall of CB and the alleged fall of GMRS can be compared, other than apples to oranges. Licensing in the GMRS at this time is at an all time high, just short of 80,000 licensees. Yes, compare this to the millions of bubble packs sold, but how many licensees own these too.

One thing CB doesn't have that we do is repeaters. And there are thousands of them, with assets well into the tens of millions. We have that alone in our group. Not to mention there are several advocacy organizations, which have stepped up to the plate to help "guard" the service and speak for all of us. To license by rule a service where many millions of dollars are invested won't be as easy as everyone thinks. CB, no real investments to deal with, no changes to make. GMRS is much different and money talks.

As licensees, its all of our responsibility to share the service with each other, while involving new people. With cell phone costs spiraling, what a better way to communicate locally with family and friends. Get some new radios, help build a cooperative repeater. The investments pay for themselves. Take care and have fun with GMRS.

Get the license, and get some real radio equipment, and use it to its max! Enjoy the benefits a license brings...like freedom from fines. And enforcment levels have increased exponentially across the US. Use it for what it was intended for, beyond Talkabouts.

Enforcement, really? How many people have been fined for using a handheld for personal/family transmissions? I would guess that the number is zero.

I have a license. It was $60 when I got it a year or 2 ago (for a 5 year term). Now it seems it has gone to $80! I was interested to see the 80,000 paid licensee figure; I had often wondered how many other suckers like me there were.

I don't think you're a sucker...more like someone who is responsible.
Use some big radios....dig into it! The benefits of having the
license like I said outweigh 20 bucks a year. You spend more than
that for a night at the movie theater! And the entertainment lasts...

You know Chris I really was not looking to nit-pick it down that much. I was really just reflecting. I would guess from your response you have no experience with the very early days of CB. So you truly could not see the apples to apples of it. We were faced with the same issues plagued today with GMRS. We had to self police and the FCC cared very little in the later years. I got out long before the licenses were dropped. I had a 3x4 cb call if that helped date me.

As to enjoying the GMRS service, I do very much. I build GMRS systems. I now live in Georgia, but back in California, if you were to use a GMRS repeater from Merced to almost San Diego, you would be using a machine I engineered. I reconditioned many Motorola and GE repeaters for a GMRS user that put them up all over the central and southern part of the state. So enjoy!

I actually am okay on GMRS handy talkies.

I am looking for 25-50 Watt Mobile Radios ...

"I am seeking a recommendation for mobile radios (25-50 watts) that allow the squelch tones to easily be changed without the use of a programmer or special interface cable. This would be for use in our cars, and on for the home.

Any recommendations?"

No, perhaps I was a bit strong. I was born in the early 70's, so in
essence missed the "wagon" with the exception of my grandfather the
truck driver, which got me into radio in general at a very young age.
The comparisons you make are indeed true, but I pointed out that the
investments than many people made is far greater than the CB when it
comes to GMRS. Look at the repeaters alone. My system alone costs
well into the tens of thousands. Not compensating for inflation
even, still seems to be a bit much of a comparison using that topic
alone. If my tone was off, I digress. Just trying to share that
there is more to guard with GMRS than CB's. Thanks for your
contribution to GMRS and 73.

Oh, Sorry. I was running out the door and din't catch the "mobile" part. I use an Icom F420, and works great. Puts out a nice 35 watts of power and has alot of features to use with repeaters and the such like time-out-timers, squelch-tail cutoff, DTMF sequences, etc. Great tool for your buck. Got mine on eBay for under $150.

Lots of others out there as well, but am unsure of their features though.

You'd need the license to operate on channels 1-7 also.
Since 22 channels are GMRS certified, channels 1-7 fall into the "GMRS channel" category, and not the FRS category. Confusing, yes. The regulation, yes.

Dig a bit more Chris, you are almost there. :) I knew many folks that had that kind of money into CB. Antennas are quite large, fancy base stations with clocks, sideband and weather alert and channel nine scan were in the 500 buck range. Tube type base radios were 1 to 2 hundred. Lets put up a 60ft tower with a moonraker 4. Yea a trucker could get a radio for 60 bucks, or less. The cheap mobile AM rigs could be equated to today's bubble pack, Unless you want to include the kids with license free walkie talkies on channel 14. And there was the funny guys, you know VFO's and power amps. So see it really is an apples to apples comparison. Of and GMRS or CB class "C" as it was known was available but man no one much could afford that gear.

thanks for helping me remember.

>GMRS IS GONE TO XXXX!!!

==========

I have to agree with Roger Lincoln(if that is his real name)that there is no real enforcement on GMRS and probably never will be.

When you call the FCC, most people there don't know what GMRS is. The compliance people are busy with more important matters, so a lot of renegades DO get away with just about anything on GMRS. I frankly think that the FCC created GMRS to give radio renegades a place to go where they would not cause much harm. Since UHF does not propagate very far, the renegades can only affect a small local area. Better to have them there than on 11 meters or the HF ham bands or the aviation band or public service channels where they could do some real damage. There's nothing critical happening on GMRS that the renegades can do much harm to, other than low priority business and family traffic.

Unless we all want user fees to rise and taxpayer money to come into play, the FCC is never going to invest the time and money to chase down violators on GMRS, EXCEPT when they receive a large volume of complaints about specific persons who are committing serious offenses.

THE GOOD NEWS is that IF you have a GMRS license and a 25 to 50 watt radio, and you use CTCSS (PL tones) or digital PL, you can develop strategies where you don't hear the renegades. With 50 watts and gain antennas your signal will override them most of the time and the FM capture effect will allow you to get through despite their efforts to interfere.

All the kids with unlicensed bubble packs won't bother you, if you just ignore them.

The $80 license fee is a fund raising tactic by the FCC that they managed to slip by congress. If you pay the fee, they will gladly accept it. Bureaucracies love money and will always find a way to use it. But no one at the FCC ever really expected people to buy a $25 bubble pack and pay an $80 fee to use it.

If they started enforcing the license fees for bubble packs, the media would go crazy, and congress would quickly cancel the fees. Can't you see the headline? "Boy Scout Prosecuted by Feds For Using

$25 Walmart Radio to Talk to His Friends." It will never happen.

Many serious GMRS users who want to use repeaters and carry on serious communications will gladly pay the fees to maintain 50 watt output, gain antenna and repeater privileges. But no significant number of people will ever pay bubble pack fees.

And, Roger, GMRS is not really going to XXXX, as you say. Mud, maybe, in the urban areas. But it is certainly not as bad as CB once was.

Freedom and democracy is sometimes tough to manage, and yet the radio spectrum services available to Americans are still better, cheaper and more accessible than most other countries in the world, possibly with a few exceptions like Canada and Japan. And maybe Monaco too, where, can you believe, Cable TV is completely free for every subject?

Good luck!

Better to have them there than on 11 meters or the HF ham bands or the aviation band or public service channels where they could do some real damage. There's nothing critical happening on GMRS that the renegades can do much harm to, other than low priority business and family traffic.

Unless we all want user fees to rise and taxpayer money to come into play, the FCC is never going to invest the time and money to chase down violators on GMRS, EXCEPT when they receive a large volume of complaints about specific persons who are committing serious offenses.

THE GOOD NEWS is that IF you have a GMRS license and a 25 to 50 watt radio, and you use CTCSS (PL tones) or digital PL, you can develop strategies where you don't hear the renegades. With 50 watts and gain antennas your signal will override them most of the time and the FM capture effect will allow you to get through despite their efforts to interfere.

All the kids with unlicensed bubble packs won't bother you, if you just ignore them.

The $80 license fee is a fund raising tactic by the FCC that they managed to slip by congress. If you pay the fee, they will gladly accept it. Bureaucracies love money and will always find a way to use it. But no one at the FCC ever really expected people to buy a $25 bubble pack and pay an $80 fee to use it.

If they started enforcing the license fees for bubble packs, the media would go crazy, and congress would quickly cancel the fees. Can't you see the headline? "Boy Scout Prosecuted by Feds For Using $25 Walmart Radio to Talk to His Friends." It will never happen.

Many serious GMRS users who want to use repeaters and carry on serious communications will gladly pay the fees to maintain 50 watt output, gain antenna and repeater privileges. But no significant number of people will ever pay bubble pack fees.

And, Roger, GMRS is not really going to XXXX, as you say. Mud, maybe, in the urban areas. But it is certainly not as bad as CB once was.

Freedom and democracy is sometimes tough to manage, and yet the radio spectrum services available to Americans are still better, cheaper and more accessible than most other countries in the world, possibly with a few exceptions like Canada and Japan. And maybe Monaco too, where, can you believe, Cable TV is completely free for every subject?

Good luck!

10979. Re: [GMRS] GMRS

Yahoo group: GMRS (2005 — 2007)
Date: 2006-03-03 17:41:07 UTC
From: neal Newman
Topic: 34 Message: 10979

Not according to the NY field Office..
Channels 1-7 ARE for FRS use therefore no license is
needed.
So NO License is Needed for Channels 1-14 as I
previously stated if used for FRS service...
These are the Rules as of March 9, 2003

Here is the Clip Right From the FCC RULES and
regulations on the FRS radio service and I Quote
"7. Sections 95.627 through 95.669 are redesignated as
95.629 through 95.671
and a new Section 95.627 is added to read as follows:

Para. 95.627 FRS unit channel frequencies.

(a) The FRS unit channel frequencies are:

Channel No. (MHz)
1. 462.5625
2. 462.5875
3. 462.6125
4. 462.6375
5. 462.6625
6. 462.6875
7. 462.7125
8. 467.5625
9. 467.5875
10. 467.6125
11. 467.6375
12. 467.6625
13. 467.6875
14. 467.7125

(b) Each FRS unit must be maintained within a
frequency tolerance of
0.00025%.

8. Section 95.629 is amended by revising paragraph
(b), redesignating
paragraphs (d) and (e) as paragraphs (e) and (f)
respectively, and adding a
new paragraph (d) to read as follows:

Para. 95.629 Emission types."
End Quote

10981. GMRS/FRS licensing

Yahoo group: GMRS (2005 — 2007)
Date: 2006-03-03 17:59:50 UTC
From: David W Proshek
Topic: 10981 Message: 10981

FRS is a radio that operates at 0.50 watts or less, and may operate without a license on Channels 1-14. GMRS is a radio that operates at more than 0.50 watts, and a license is required to operate on channel 1-7, and 15-22. You cannot operate at more than 0.50 watts on Channels 8-14, as these channels are reserved for FRS radios.

I don't know if this will clear up some confusion, but that is how it is stated in manuals received with my GMRS radios.

By the way...I am licensed for GMRS use (WQEI-828).

Have a great day everyone.

On an *FRS* radio yes. But NOT on a GMRS radio. If a radio is type accepted under Part 95A rules, it is considered a GMRS radio. As such *all* 22 channel radios require a license on channels 1-7, as they are considered GMRS, and NOT FRS channels. Since they have the capability to operate at the higher power levels allowed only under GMRS rules, they are not considered FRS radios.

This fact has already been clarified by the FCC.

10983. Re: [GMRS] GMRS

From: David Proshek
Topic: 34 Message: 10983

if you would have read what I said.....an FRS radio can ONLY operate at 0.50 watts or less.....a GMRS radio operates above 0.50 watts. Channels 1-7 are considered both GMRS and FRS, but it depends on your operating power. If you have a radio capable of operating at higher powers, but ONLY operate at 0.50 watts or less, then you are not required a license on channels 1-7.

10984. [GMRS] radio regulations for GMRS portable repeater

Yahoo group: GMRS (2005 — 2007)
Date: 2006-03-03 13:55:22 UTC
From: CHRIS ELEYETTE
Topic: 10946 Message: 10984

hello all,
I'm wondering what do the rules say
concerning loaning a portable gmrs repeater to a local
search and rescue group. Has anyone done this?
thoughts?

thanks,

chris

Chris writes: "I'm wondering what do the rules say concerning loaning a portable gmrs repeater to a local search and rescue group... this? thoughts?"

Chris, I am certain that nothing in the rules state that one has to OWN the equipment to use it... with that in mind, remember that EVERYONE using the system has to be INDIVIDUALLY LICENSED (let me explain - a GMRS license covers ONLY the immediate family members).

Assuming that not all the members of the search group are family related - a fairly safe assumption - then each family would have to be licensed. If there are 100 members in the search group (none of whom are related to each other), that would be a grand total of $8000 to be raised to provide a five year license to each member of the group to use GMRS radio systems.

Let me add to that one significant fact - if the radio
is either:
a) equipped with a removable antenna; or

b) capable of transmitting at a higher power than
specified for FRS

then it is not legally an FRS radio and may not be
used as such.

I spent an hour and a half researching my reply to this one, to cover
my response with facts.....

Well... you are gonna love this!

It appears you could very well be 100% correct :(

I looked up some FCC equipment grants.

Here is one cut and pasted.

NOT TRANSFERABLE
EQUIPMENT AUTHORIZATION is hereby issued to the named GRANTEE, and is
VALID ONLY for the equipment identified hereon for use under the
Commission's Rules and Regulations listed below.

FCC IDENTIFIER: KLL2101904

Name of Grantee: Tekcom Industries Limited

Equipment Class: Part 95 Family Radio Face Held Transmitter
Notes: 22CH FRS/ GMRS Transceiver

Grant Notes FCC Rule Parts Frequency
Range (MHZ) Output
Watts Frequency
Tolerance Emission
Designator
95A 462.55 - 462.725 0.832 5.0 PM 11K0F3E
95A 462.55 - 462.725 0.457 5.0 PM 11K0F3E
95B 462.5625 - 467.7125 0.457 2.5 PM 11K0F3E

Listed Power is ERP. This device is authorized to operate in the
following radio services: FRS (Part 95B) or GMRS (Part 95A). There
must be an informational insert inside the box (product package) or
the User?s Manual must include information that clearly informs the
consumer (buyer/owner) when the radio is transmitting on GMRS
frequencies, that operation on GMRS frequencies requires an FCC
license and such operation is subject to additional rules specified in

47 C.F.R. Part 95. This device complies with OET Bulletin 65 for General Population use. The highest reported SAR levels are: Face-Held 0.925 W/kg for 50% Duty Cycle, Body ?Worn 0.950 W/kg for 50% Duty Cycle.

This is from a RadioShack "bubble pack I own."

Notice the services *and frequencies* in which this radio is type accepted for;

95B 462.5625 - 467.7125 This radio, a RadioShack unit is type accepted for ALL FRS frequencies, as it has Part 95B certification for ALL FRS frequencies.... not just 7-14.

I looked at a couple more grants... all with 14 channel FRS certification.

This contradicts a lot of information I've been exposed to, handling this debate on other forums, including the FCC's own web site with its vague descriptions.

From the FCC GMRS Home page:

FRS/GMRS Dual Service Radios:
Some manufacturers have received approval to market radios that are certified for use in both the Family Radio Service (FRS) and the General Mobile Radio Service (GMRS). Other manufacturers have received approval of their radios under the GMRS rules, but market them as FRS/GMRS radios on the basis that:
Some channels are authorized to both services, or
A user of the radio may communicate with stations in the other service.
Radios marketed as "FRS/GMRS" or "dual-service radios" are available from many manufacturers and many retail or discount stores. The manual that comes with the radio, or the label placed on it by the manufacturer, should indicate the service the unit is certified for. If you cannot determine what service the unit may be used in, contact the manufacturer.
If you operate a radio that has been approved exclusively under the rules that apply to FRS, you are not required to have a license. FRS radios have a maximum power of ? watt (500 milliwatt) effective radiated power and integral (non-detachable) antennas. If you operate a radio under the rules that apply to GMRS, you must have a GMRS license. GMRS radios generally transmit at higher power levels (1 to 5 watts is typical) and may have detachable antennas. The current fee for a new GMRS license is $80.
Licensing
Before any station transmits on any channel authorized in the GMRS from any point within or over the territorial limits of any area where the FCC regulates radio services, the responsible party must obtain a license. The FCC usually grants GMRS system licenses for a five-year

term. To apply for a GMRS system license, you may file online through the Universal Licensing System (ULS), or file FCC Form 605 manually. New filers can learn more about ULS in its getting started tutorials. See Fee Requirements for FCC Form 605 (pdf) for current licensing fee information.

Tell me if this supports my earlier stand, or supports yours.

Regardless...

All I can say is I believe I stand corrected. If a "dual service" radio is certified for full access to FRS, then there you go.

In all my research, I have supported your point.

What the hell.... I didn't have anything better to do, except spend time with the wife and kid before bed.

Damn I love the FCC doublespeak.

10989. Re: [GMRS] GMRS

Yahoo group: GMRS (2005 — 2007)
Date: 2006-03-04 02:14:20 UTC
From: kvsp1160@aol.com
Topic: 34 Message: 10989

Pulling out the rulebook again:

Part 95.29 States:

(f) Except for a GMRS system licensed to a non-individual, a mobile

station or a small base station operating in the simplex mode may

transmit on the following 462 MHz interstitial channels:

462.5625, 462.5875, 462.6125, 462,6375, 462.6625, 462.6875 and 462.7125.

This came from under Part 95A, of the GMRS rules. Which is part of the GMRS license system.

And also Part 95.621:

(a) The GMRS transmitter channel frequencies (reference frequencies

from which the carrier frequency, suppressed or otherwise, may not

deviate by more than the specified frequency tolerance) are 462.5500,

462.5625, 462.5750, 462.5875, 462.6000, 462.6125, 462.6250, 462.6375,

462.6500, 462.6625, 462.6750, 462.6875, 462.7000, 462.7125, 462.7250,

467.5500, 467.5750, 467.6000, 467.6250, 467.6500, 467.6750, 467.7000,

and 467.7250.

This also states that the above frequencies (channels 1-7 of the FRS, as most people refer to) are a part of the GMRS licensing system.

Now this does not state that you must use your GMRS license while using these frequencies. But it it assumed so, as it falls directly under the GMRS system FRS system.

Great! Go for it! Help them out. But... Do they have a license?

Key question there. Doesn't matter what equipment you own or where it is, as long as the other user has a license to operate that radio equipment on that specific service, then it is legal. If not, then you are dealing with guilt, fines, FCC, and others.

Hey,
The license aspect of this is not that hard. We use GMRS in our training and have the appropriate licenses. We buy our own equipment and pay for our own licenses. We started out with the bubble pack frs when it was in the $80 a pair range and upgraded to the 3 to 5 watt units when they came out (for less than the original .5 watt radios). I mainly use the Icom F21 with a external mic but we have had several situations where a repeater would be a real help. We really have our hands full with our dogs and no one has had the inclination to experiment with a portable repeater.

Exactly correct Duane

The Talkabouts /and clones have a NON- detachable
antenna.
However certain model Talkabouts
(A) run 1/2 watt on channels 1-14 and 1 watt
channels 15-22.
(B) Others run 1 watt 1-7 1/2 watt 8-14 and 1
watt 15-22..
(C) some run 2 watts 1-7 1/2 watt 8-14 and 2 watts
15-22
they all have Non-detachable antennas
However the only one thats legal as FRS no license
is the (A) version listed above.
Both (B) and (C) run More than 1/2 watt on
channels 1-7 these DO require a GMRS License.
Its Very Confusing for the Consummer to know what
he/she is really Getting and which units
actually need the GMRS license.
BTW these Group (A) radios are Getting harder To
Find.. My Guess is 90% of the radios aout there are
the Group(B) Version radios.
and thats what is going to flood the GMRS Frequencies

My Moto T-5500s are of the ones in group B. They have no indication of any Part 95 acceptance. Only Part 15 is mentioned on the inside of the battery cover. There is an FCC ID label displayed under the batteries. The average consumer does not know what to do with this information and does not care. The radio works when it is powered. That's it.

There is an insert that came with the radios about licensing information. It states that channels 1-7 and 15-22 are GMRS frequencies and that an FCC license is needed. (The fact that they put out 1 watt is stated in the manual). The need for licensing is spread liberally throughout the manual. However, you are still on the honor system to apply for the license and pay the appropriate fee. And to that, there's even less urgency for the average consumer to apply for the license than to fill out warrantee cards for other purchased items.

When I first got a broadcast license in the 70s, there was a generalized great fear of the FCC. Now its FCC who? Oh, yeah, the guys that keep redrawing the line in the sand about HDTV!

Not anymore. It used to be that way, you could get a group license, but the FCC has knocked it down to individual (with immediate family included) only. You will find there are still some groups and companies out there that have kept up their licenses and are still grandfathered.

Kevin
Yep... Because that radio Runs at 1 watt on channels
1-7 its GMRS.... the power is the determining factor
not the channel Numbers..
still have that Commercial license?
When they removed the First class and made it a
general class I put mine in the garage Filing cabinet
Of course we had a house fire and it was destroyed.
That didn't matter to me since I am stil in
Broadcasting,and has not affected My job position.
With My reputation I doubt I would ever need to have
it again.Even if they(FCC) were to re-instate it as
required. Years of dealing with them I would probably
be Grandfathered Because of experience.
That's Like when I went to College. they accepted My
Scuba certification,Pilots Licenses/ wildlife
certifications, Even My FCC Licenses as CREDITS..
just those listed alone was worth about 21 credits
with about 3 credits Each.
scuba=3
private pilot=3
Instrument rating was=3
Commercial was 3
falconry/wildlife Rehabilitators was =3
wildlife Lecturing certification=3
that was like Doing a thesis for a doctorate LOL
My FCC commercial was =3
So If you guys have kids in college, and are into
these things or Not.. you can save some credits..
food for thought..
LOL

Anything that uses a transmitter or receiver inside equipment registered under the FCC will always be under Part 15. This means that it should not interfere with other equipment and should accept any other type of interferrence.

Kinda like Televisions; also under Part 15. So if you hear your neighbor using his linear onver your TV, you may talk with him, but your TV has the right to accept interferrence.

Not every piece of equipment will have a sticker saying what Part it's covered under. You can add one... But most people won't look it up anyways.

The FRS and GMRS both are Part 15 and Part 95 Type radios. they can cause interferrence and can accept inteferrence, because they have transmitters and receivers inside them.

I think I answered part of your email. Not most or all of it, but at least we're a little more clear on the Part 15 thing now.

11002. [GMRS] Portable repeater antenna system

Yahoo group: GMRS (2005 — 2007)
Date: 2006-03-06 00:42:28 UTC
From: CHRIS ELEYETTE
Topic: 10990 Message: 11002

Hey all,
Any suggestions for a portable repeater
antenna setup? I'm not sure about using a duplexer.
I might do better with two antennas then with a
duplexer. What do you all think?

thanks,

chris

11003. Re: Portable repeater antenna system

Yahoo group: GMRS (2005 — 2007)
Date: 2006-03-06 01:04:21 UTC
From: Duane Vincent
Topic: 10990 Message: 11003

Chris, I have built an antenna system with a home-made shoe, 6 surplus military 40 inch fiberglass poles, and a discone antenna. Right now, I don't have any pictures for you, so you will have to let your imagination work...

The masting is surplus military antenna masting, available on eBay for about $2.50 each, plus shipping.

Look at this eBay auction: 5876080779. I chose the ones with the reinforcement rings.

The "shoe" is a piece of 1/4 inch stainless steel flat bar, about 5 foot long with a "U" shaped flange at one end. Stainless steel is only an option (an expensive one at that). The original was simply fashioned out of a piece of steel flat bar with a non-movable caster welded to it at one end. The "U" has to have a bolt hole through it to pin the fiberglass antenna mast to it.

I drive up on the antenna mast flatbar, and assemble the discone - the discone coax drops through the inside of the 2 inch military poles, and the bottom of the 6 poles then is pinned to the "U" flange. The assembled antenna structure is then raised to the vertical position, where it rests against the bumper of the car. The mast is then secured to the car with bungee cords, and from near the top of the masting I plan to run a non-conductive line to the front bumper to keep the mast in place.

Because of the "U" shaped flange, the antenna mast isn't going to go anywhere... the bungee cords and non-conductive line keep the mast in place and vertical. If I really wanted to do a great job on securing the mast in place, I could use a ring collar on the antenna mast and tie it down in three places.

Does this all make sense?

Even though I highly suggest a duplexer, you could go with a two-antenna setup.

I'd suggest either a dipole or yagi (depends upon what type of system you want to achieve) for thransmitting, and a discone antenna (from Rat Shack) for the receive side. But for the receive side, I'd at least put on a filter of some kind.

But again, I highly recommend a duplexer. This way, you could use a dipole as your main antennas and not have to carry two antennas. Use two 5-foot masts and the roof tripod from Rat Shack as your ground support. A simple, yet portable and structure-effective setup that doesn't cost a whole lot.

Trust me, I've got the same setup here at home besides my main repeater system. But I use my field equipment for other uses, not for repeater systems.

Chris, I can't tell you what the range is on a discone antenna. There are too many variables, including height above average terrain (for example, being on a hill vs. being in a valley).

You need to use the very best coaxial cable that you can buy. First of all, that means STAY AWAY FROM RADIO SHACK JUNK. I have stripped RS coax, and found it to be very poorly braided.

My personal preference is Belden RG-8X coax. It is about the best low-loss coax generally available. Also, Amphenol PL 259 plugs on each end.

The discone antenna that I use is made by MFJ, and costs about $40. This is where I buy my stuff from:

http://www.hamradio.com/

Shipping via UPS is generally without cost, provided that your order is for $100 or more.

Discone antennas have both their supporters and detractors. A discone antenna is omni-directional, which has both good and bad points about it. It all comes down to choice between a narrow focused beam antenna that has to be aimed, and one that has an all around signal capability.

Topic: 11007 Message: 11007

Since I Mentioned a discone in mine as well, I use RG8 coax on mine which runs at about 50 ft/$20, but you could buy better coax if you so choose. it's only 60-75% shileding, so you're loosing some signal if you run longer than 50'.

The discone can receive from 25-1300 MHz, and can transmit on 144, 222, 440, 800MHZ, and 1.2 GHz. Which is why I recommend the filter.

It shaped like a 3-D cone (like you learned in school), with a vertical dipole on the top. There are different types of discone antennas. Here's some for you to see:

http://cgi.ebay.com/MFJ-1868-New-Discone-Antenna-25-1300-MHz_W0QQitemZ5873552603QQcategoryZ4672QQrdZ1QQcmdZViewItem

http://cgi.ebay.com/Sky-Scan-25-1300mhz-Double-Discone-Antenna_W0QQitemZ5872665981QQcategoryZ40979QQrdZ1QQcmdZViewItem

http://cgi.ebay.com/Discone-Scanner-Aerial-Antenna_W0QQitemZ5875168196QQcategoryZ40979QQrdZ1QQcmdZViewItem

http://cgi.ebay.com/DOUBLE-DESKTOP-RADIO-SCANNER-DISCONE-AERIAL_W0QQitemZ5876159431QQcategoryZ40979QQrdZ1QQcmdZViewItem

I use the standard model (the first one I listed) in my portable setup. Works great and very compact down to 2" in diameter by 14" long (excluding the coax and short supporting mast).

Hope this helps, 73!

Hi Duane,

I don't know and kinda disagree about the RG8X. I've looked into that and finally went with my choice of LDF4-50A heliax, which has a much lower loss that the RG8X. Do you have specs that you could send for comparison? I can send mine if you want.

I run a tram antenna I got on eBay and 9913 coax left over form my last ham radio antenna upgrade, only about 50 feet and that works, I would like to have the antenna higher but haven't been able to work that out yet. it does a good job for where it is though, actually good enough except some times with certain weather conditions where getting it up higher I think would get it above some things around it and would make it perfect for my uses.

Ryan, I can't afford heliax... that stuff is just too pricey.

The MFJ that I use - the one that costs about $40 from HRO - is rated for transmit at 144 and 440. Don't remember about 220 Mhz.

RG8X at 60% shielding? I think it is much higher than that, especially if you use quality stuff such as Belden. RS RG8X might be 60% - I won't touch the stuff.

I would recommend LMR 400 coax, or 9913 coax and use N-type connectors. As far as an antenna goes, you can build a vertical dipole and house it in a piece of 1" PVC pipe. The cost is less than $10.

Cris - KU6A

From: Blake Bowers
Topic: 10990 Message: 11014

How do I figure? With a calculator.

How do I find that LMR400 is evil for repeater
operation? From years of experience as a two way
radio shop - and from like experience from other users
across the country.

LMR400 with its braided cable is a breeding ground for
noise generation.

11018. Re: [GMRS] Re: Portable repeater antenna system

Yahoo group: GMRS (2005 — 2007)
Date: 2006-03-06 07:11:13 UTC
From: kevin asato
Topic: 11007 Message: 11018

I used to have a HiGain discone and ran less than 50 feet of RG-58(!) to it. Antenna was mounted at about 15 feet above the ground and would regularly get into San Diego (Spring Valley) on 2 meters from the South Bay area of Los Angeles on 5 watts at the back end of the transmitter. Distance covered was about 100 miles. I got lucky as I lived in an area which looks down toward San Diego via the coast. (A way of saying that your performance will vary!). I did not get a chance to check out the 440MHz performance which is close in frequency to GMRS.

Antenna was not the most efficient and we know the coax definitely is not. I bought it for scanning in the local area. The point is that suboptimal materials as the RG-58 do work. Just don't expect the performance to last (although this one was good for a couple of years before I had to take it down for a move).

Would I do this same thing if reliability was a concern - no. I would probably use something more rigid like a 1/4" copper pipe J-pole, better rf connectors (N), and better coax. The J-pole is a quite a bit more frequency specific than the discone and is definitely more rugged! Ruggedness - well, both the HiGain and the Comet discones I have owned are constructed of soft aluminum elements. On the Comet, the elements are screwed into the mount. The weakness is the part of the element that is just outside of the mount. I know, I broke off a couple of skirt elements when I tried to re-raise the antenna in another location.

The J-pole weighs about as much as a discone and exhibits more gain which can be used to offset part of the loss of signal in the coax. They are also easy to build if you can sweat-solder. Your local Home DIY stores have all the parts (excepting the rf connector). There are also vendors which make J-poles cut for GMRS - just do a search on GMRS and antenna. I don't have any recommendations as I would rather build my own.

11019. Re: Portable repeater antenna system - RG8X coax

Yahoo group: GMRS (2005 — 2007)
Date: 2006-03-06 07:15:01 UTC
From: Duane Vincent
Topic: 11007 Message: 11019

Ryan wrote: "I use RG8 coax on mine which runs at about 50 ft/$20, but you could buy better coax if you so choose. it's only 60-75% shileding, so you're loosing some signal if you run longer than 50'."

Ryan, here are the specs direct from BELDEN on their RG8X coax:

RG-8X Type - 15 AWG solid .057" bare copper

95% tinned copper braid shield.

This is the coax that I use and recommend. All of the Belden RG8X coax is sweep tested with a max VSWR of 1.25 to 1.

Again, the specs direct from BELDEN on RG8/AU coax:

90% braid shield.

If you have coax with only 60-75% shielding, it must be some of that Radio Shack junk. It certainly isn't BELDEN.

11020. Re: Portable repeater antenna system - discone vs. J-pole

Yahoo group: GMRS (2005 — 2007)
Date: 2006-03-06 07:24:51 UTC
From: Duane Vincent
Topic: 11007 Message: 11020

Kevin writes: "The J-pole is a quite a bit more frequency specific than the discone and is definitely more rugged!"

Quite true. Which is why I am using a discone for the portable antenna system - feeding both a VHF and a UHF transciever into one antenna through a decoupler.

I have built and installed a J-pole out of 1/2 inch copper pipe as a stealth antenna on my house, and the SWR was measured out at 1.2 to 1.0. At that time, I decided to quit pruning the antenna. How did I make it a stealth antenna? The antenna was covered with a vinyl extension designed to take water away from the downspout. Coax and the J-pole stub are hidden away in a PVC pipe attached to the house. One has to be creative when living in an antenna restricted area.

Curious, What do you think about LMR600?
And at less then 100 feet, why would the cable
you say is evil (LMR400) not be better then
RG-8? I look forward to your response....

There are two possibilities:

a) the group had its' license prior to the effective
date of the change (grandfathered)

or

b) the group is operating in violation of the FCC
regulations.

Some TEAMS may still have a grandfathered GMRS license. If there license was issued before FCC changed the rules, then as long as the team ONLY renews the license each year and does not MODIFY/CHANGE the license then it?s still valid.

If there team was not grandfathered then each member must have there own license.

LMR 600 is a GREAT base station line.

And I never said that LMR400 was worse than
RG-8, I just said overall, it was evil.

11031. RE: [GMRS] Re: GMRS group license

Yahoo group: GMRS (2005 — 2007)
Date: 2006-03-06 21:09:11 UTC
From: Joe
Topic: 34 Message: 11031

What area of Fl?

You can check the GMRS license using the ULS to determine if the license is grandfathered.

If is not they are in violation of FCC rules.

-----Original Message-----
From: GMRS@yahoogroups.com [mailto:GMRS@yahoogroups.com] On Behalf Of Duane Vincent
Sent: Monday, March 06, 2006 3:09 PM
To: GMRS@yahoogroups.com
Subject: [GMRS] Re: GMRS group license

"I find that interesting as the react here in my area
of Florida uses unit numbers assigned to a single call
and have for quite awhile when running official nets
and support operations."

There are two possibilities:

a) the group had its' license prior to the effective
date of the change (grandfathered)

or

b) the group is operating in violation of the FCC
regulations.

Roger Lincoln <orcoscan@...> wrote: Date: Thu, 2 Mar 2006 19:27:47 -0800 (PST)
From: Roger Lincoln <orcoscan@...>
Subject: Re: [SoCalScan] FCC Question and transmitter location
To: socalscan@yahoogroups.com

Transmitter location information is sometimes intentionally falsified on the license application. There is a case pending with the FCC of license KAD3271. They had listed a address on Euclid in Anaheim on the renewal application and when the FCC went to verify, there was no transmitter at the location, and it hadn't been there for years. I don't know for sure but I think Ed knows the details of that case.. Can you elaborate some on it Ed????

ED GREANY <crest25@...> wrote: I show that the first location is at a complex with many cars parked in the rear located on Seabright between W. Cowles and W. Anaheim at the East end of W. 4th where it runs into Hayes in Long Beach. This is close by and west of the 710.

> Anybody have an explanation for no specific location.

Looking at
http://svartifoss2.fcc.gov/cgi-bin/ws.exe/genmen/uls/uls_site_res.hts?db_id=19&link=WPLY766&application_id=
(or http://tinyurl.com/hztzu) it says the Area of Op for the temp fixed
and mobiles is within 48 km of the two locations,
33-47-01.1 N, 118-13-05.3 W and
33-24-18.1 N, 118-25-00.3 W

From Terraserver, it looks like the first one is in the Wilmington area,
and the second probably on Catalina Island.

Well did not mean to start something because it is a needed service here during the storms ! I would assume they would be operating legally and have some very good people that are familiar with the rules. I just did a search of all of Florida just to give some examples of group licenses. I guess the best way to point out a few things is to give an example of organizations like local goverments that have GMRS licenses that have been issued as recently as 2005. Was this before or after the change? Well here is the call and goto the fcc uls page and see what you see ---- KAC9963 ---. Or maybe this link will work since I am going to send it in html

http://wireless2.fcc.gov/UlsApp/UlsSearch/license.jsp?licKey=195332

Now if there are plenty of frequencies for govt. and they have their own frequencies why would a county be granted a GMRS License in 2005?

Does it matter to me? No as we all have to work togeather on GMRS and at least they have a license!

Some TEAMS may still have a grandfathered GMRS license. If there license was issued before FCC changed the rules, then as long as the team ONLY renews the license each year and does not MODIFY/CHANGE the license then it's still valid.

If there team was not grandfathered then each member must have there own license.

No problem Steve ? Although KAC9963 was originally issued prior to 2001 or even 2000. My call sign was originally issued in 1996 and have a KAF call. So I?m sure that KAC was prior to 1996. The FCC database only shows the most recent applications. I believe that Eric Conklin was instrumental in assisting BCEM in attaining there call sign on GMRS.

Brevard County, Florida operates a GMRS repeater that meets case a) below.
They use it for county operations as well as for the County Emergency Operations Center (EOC)>

The administrator there considers it a valuable resource, because such a license is only possible due to the "grandfather" clause. With prior permission, they treat it as an open repeater, but require a copy of your personal GMRS license, and assign you a "handle" to readily identify yourself (although your FCC call sign must also be used).

Their system is configured with four geographically separate input antennas, and one repeater output antenna approximately 400 feet HAT.

There are not many repairman around anymore. The last "real" 2-way repairman I knew was in his '70's & maybe his 80's, when he retired.

I have called several people up (in unrelated fields) that were "retired" and asked them for a reference. They all jumped at the chance to help me. No reference, "just bring it around" and they fixed me right up.

The man I am thinking of was an old geezer out in Tavares that had a Motorola dealership for years and years. Other people around there got Moto dealerships, but they couldn't really fix 'em and he could. So despite is lack of slickness and pretty salesgirls, he did okay.

He may still be alive, I dunno. I can attest to his hands being steadier than mine 3 years ago. He knows how to solder rather than replace. His rates were very reasonable.

Would you like for me to find him? He would probably want to work on it at home. I'll just bet he has a bench there.

I am posting this to the newgroup in the hopes that others will realize that "retirement" is probably a fairly dead concept of the 40's-90's. And that they should not hesitate to call someone they think is no longer working -- even if it is only to ask for a reference.

Topic: 11043 Message: 11043

Now there is a difference between RG8 and RG8X. It's the size and performance. Radio Shack uses RG8, while you say you use RG8X. Big difference.

The only reason why and how I got the heliax is because 1) I have a repeater system here that requires it, 2) it was free, and 3) I exchanged it for free membership to my repeater system for the guy who gave it to me.

Ya, at about 100 feet, it would cost me around $800! but I believe that it was a very kind thought on his part and an even swap on my end to help with our setup.

Although I don't agree with my choice of buying the RG8 at Rat Shack, it's a good start for those with low income and starting in the radio world. I originally used it back in the days of my CB base station, then now use it for my portable system. It's not critical that I keep all 100% of my signal, but I also don't need to run over 50' as well (and I bought 100' of this stuff back then!).

RG8X is slightly smaller, but does have a thicker shield and will give you more for your buck. I believe it will also cover 85% of your signal, unless you go with a higher coax like the Andrew Heliax that I have.

However, I don't care how good of a deal you get or what people say, do not buy that cheap RG58 or RG9 stuff. Junk and not worth your time. It's what your mobile antenna coax is made out of, and why you loose so much signal on the way down. Also why the manufacturer only gives you a short amount of cable.

Topic: 34 Message: 11044

Here's the original Database of KAC9963 as of 04/24/1995:

http://wireless2.fcc.gov/UlsApp/ApplicationSearch/applAdmin.jsp;JSESSIONID_APPSEARCH=EMtZ3zevH6cl38xmNB0b93fEjbVXC74vOj1Ay8Mn8FSrJq6a1y1N!991088414!1850932078?applID=263782

I had to do some simple digging, but I finally found out who they were. Their mode is listed as a VEC/Coordinator/COLEM. Their type is listed as a Governmental Entity.

Their Public Address is listed here:

http://wireless2.fcc.gov/UlsApp/UlsSearch/license.jsp?licKey=195332

Their license expires 06/01/2010.

Don't know what else you'd need. Hope this helps.

How do you do this, 4 seperate input antennas and 1 output? Remote base links? Curious...

2 ways to do this
First is to use the same receiver Freq at all 4
locations. 1 location Being at the transmitter site
with 3 remote bases or 4 remote locations as you
stated each with a link frequency and 4 differnent Pl
tones. at the transmitter site you could have in the
rack 4 different link receivers with the 4 tones going
into a Voting System which detects the strongest
signal to Noise ratio and puts that receiver on the
air. before another receiver.
or it could place all 4 receivers on at the same
time through a Mixer,

the second way of Doing it is to Be involvd in the
local County/state Communications network.
and have the receivers at any 4 of their locations
and the transmitter at the County/state Communications
Site
and instead of Radio Links .Ride on a spare Link
channel From their sites Either microwave or Fiber
Optic however they are setup,
and again Once at the transmitter site using a
voting system(Doug Hall makes one for Ham repeaters

Im sure it would work on GMRS also.

Topic: 34 Message: 11048

I could agree if you run an optic line, but a microwave link is another service. GMRS specifically states this clearly in the points below.

Parts:

95.127: (e) "Any device used to establish a wireline control link which is attached to the public switched telephone network after April 1, 1976 must be registered with the FCC and must comply with the standards incorporated in a registration program to protect the public switched telephone network from harm (see part 68 of the FCC Rules)."

95.141: "No station in a GMRS system may be interconnected to the public switched telephone network except as and in accordance with the requirements and restrictions applied to a wireline control link (see §95.127)."

95.181: i) #13 "A station operator must not communicate... Messages which are both conveyed by a wireline control link and transmitted by a GMRS station (see §95.127)."

I, however, have searched the FCC Part 95 database from 1997 thru 2005 and found nothing stating linking to other radio services or by using other means of transmissions for voting. A GMRS repeater just wasn't meant to be used in that way, therfore they never wrote rules pertaining to that.

I did find rules that I knew never existed:

http://www.fcc.gov/Bureaus/Engineering_Technology/Documents/cfr/1996/47cfr95.pdf

Go to www.fcc.gov and do a keyword search for "part 95" or for a specific part, and you'll find interesting stuff.

While I do agree that cross-service remote receivers utilizing a
voting system would be a no-no, I have often wondered whether one
could legally utilize part 15 for "remote receiver to voter" audio
transport. I suppose the "must not cause any interference"
and "must accept any interferrence" statement in part 15 could be
pretty tough to comply with depending upon the distance to the
voting/transmitter site.

Food for thought.

"I find that interesting as the react here in my area
of Florida uses unit numbers assigned to a single call
and have for quite awhile when running official nets
and support operations."

There are two possibilities:

a) the group had its' license prior to the effective
date of the change (grandfathered)

or

b) the group is operating in violation of the FCC
regulations.

I don't see why you cannot use the spare bandwidth of
a _privately owned_ microwave link to carry received
audio?? What the rules specify are the use of linked
repeaters ala amateur radio. Having remotely linked
receivers to improve the coverage area of a single
common transmitter does not fit that description.

The excerpts below specify wireline and PSTN -
wireline is another euphemism for the phone company
and their cable plant.

The reference to Part 68 is what telephones and modems
need to comply with to interface to a phone company
network. This is the regulation that a "wireline
control link" (aka repeater control link) must comply
with in order to connect to a telephone line.
Simplified, it basically says that you will not inject
harmful voltages and that signal levels are not
overdriven to cause crosstalk in adjacent cable pairs.
The other part to 68 is that you have to tolerate
foreign voltages and certain levels of crosstalk.

What the excerpts say is that short of visiting the
mountain top everytime the repeater malfunctions or
you want to see how it is performing, you can
interrogate and control it remotely via a telephone
connection (using DTMF or modem/RS-232).

If I may hijack this for a moment...

LMR cable is braided for a shield, and as the coax tends to weather or break down from natural use, noise becomes apparent in the RX, from being excited by the transmit signal. It doesn't take long for this to occur. Hardline is better because there are no braids in the shield to break down and cause noise, which can be caused by arcing between the braid fibers.

I think you need to rewrite that short part. DTMF can either be part of a phone/land line system or via transmitted "DTMF" signals on your frequency to the repeater using only your tone and callsign, etc to allow this to happen to make corrections to the system.

But my main concern wasn't to argue a point that you couln't link repeaters with another radio service. I simply proved that our Part 95 rules don't cover it, and it wasn't meant to do that within this system. If you can find a way, and the FCC gives you a green light, then it is possible.

But most families, groups, and individuals also don't have that kind of $$ to just pour out into their system, especially into a GMRS system that can only do so much. And especially in CA and other states where we have high-living costs and families to raise. It's a great idea, but unless you got that type of source or fund to do that, then it's thumbs down for most around here.

I'd say, get your ham ticket and do a whole lot more in the ARS with your repeater system. Few restrictions and a lot more fun. I just passed my practice exam. Just need to take the official one.

From: Duane Vincent
Topic: 34 Message: 11061

Larry (ve3fxq) writes: "If I was involved in your grms group, I would want to get a licence specifically for me.. That way I can function on my own as well.... and once I found out how good? gmrs was I might consider getting a licence for each of my suitably aged family members....That was I can also get them on gmrs as family members...."

Larry, in the Unites States, a single GMRS license covers all immediate family members. Is the same not true in Canada?

Topic: 11062 Message: 11062

Hello all,

New to the group and would like some info on buying a radio.
I need a GMRS hand held (At least 3 watts) with a detachable antenna.
Also a ready made base station antenna and a magnet mobile mount. All
legal. Our need is urgent to help monitor a sick relative. My wife and
I are complete novice's but thanks to this site I'm more informed then
I was two hours ago.

Great reading.Thankyou.

Hope to hear from someone soon.

What I've had some good luck with, is a 'paint pail' antenna.

Get a 5 (or 10) gallon METAL paint can (not the ones the paint comes
in from the store, the ones with the sloped sides).
Mount a 1/4 wave mobile antenna, 6 inches from the bottom of the pail.
Use the appropriate connector to fit your handheld.

Very directional.

While GMRS is good, there is also MURS for which you and the relative will need no license. Check out the below links and ask around.

MURS on 151 MHz actually travels farther than GMRS on 462/467 MHz
when you're working simplex.

BUT... MURS has no repeaters, so the possible range with GMRS is far
greater when you're using a duplex repeater on GMRS.

AND... MURS is limited to 2 watts while you can run 50 watts on GMRS
with a license.

11066. Directional antenna design for ICOM F21GM Handheld

Yahoo group: GMRS (2005 — 2007)
Date: 2006-03-10 23:56:05 UTC
From: Lake Hodges Radio
Topic: 10879 Message: 11066

>--- In GMRS@yahoogroups.com, Chris Catotti <kd4ace@...> wrote:
> > I would like to "foxhunt" some GMRS radios with my ICOM F21GM handheld.

>connecting to the handheld?

One technique is to use your radio with only the supplied rubber duck antenna.

Hold the radio vertically against your stomach or belt buckle with
the antenna pointing up. Turn around 360 degrees until you hear the
weakest signal. This is a null. The null will be behind you, along
a line from your radio through your spine. That's the direction
towards the fox.

If the fox signal is strong, remove the antenna from the radio to
decrease the gain. Use small, non-resonant stubby antennas (or wood
screws) if you need more gain than you get with the antenna removed.

Get two or three bearings towards the fox from different
locations. Where the lines intersect, you will find your fox.

This works pretty well and is very inexpensive.

I have had better luck with UHF and coverage, have just had a camp on VHF
154.600 and we switch them to UHF and the coverage is better.

11068. Re: [GMRS] Which radio and where

Yahoo group: GMRS (2005 — 2007)
Date: 2006-03-11 14:19:58 UTC
From: kvsp1160@aol.com
Topic: 11062 Message: 11068

Okay, so the guy wanted to know about some HT's with detachable antennas...
Any reason why the detachable antennas? Specific type: BNC, SMA, TNC, etc...?

There are alot of great HT's on the market that are new that you can buy for GMRS, that are also covered under part 95. Ritron, Jobcom, Motorola, Icom, and Kenwood are a few to mention. Then there are the older models that you'll see on eBay. These require programming by yourself or a radio shop, or maybe internal crystals... a pain, but worth the small % that you fork out for them. And most come in lots too.

The only base station that I'm aware of on the market is made by Audiovox. Only puts out a few watts though. Not worth the price. I'd buy a GE Mastr II series Base radio and install a couple of crystals. both are cheap on eBay (I have one for sale), and are also great resources for repeater conversion. (you might need a base antenna to go with that. get something simple, also on eBay).

Magnet mobile mount antenna's now come with the NMO mount antennas. 1/4 wave, 1/2 wave, 2dB Gain, etc... Depends on what you need it for. Ranges from $20 to over $80 for a mobile setup. For a base, from $40 and up.

You'll need coax. Since you're starting out and are running a short distance, go buy RG8 coax at Radio Shack. ** For runs under 50', you won't loose more than 20-30% of your overall signal. But their shield is good. Or get some good stuff also on eBay like LMR-400 or RG8X, but can be a bit costly.

I know you wanted something simple. I'd honestly start out with a few HT's (hand helds) and a 4+dB gain mobile or base antenna for at home. That should get you out farther until you can use a repeater or build your own. And your GMRS license covers your repeater system if you decide to build one.

Hope that helps. 73,

Ryan

The reason I suggested MURS as an option:

>New to the group and would like some info on buying a radio.
He has no radios yet, MURS HTs may be had for less $.

>I need a GMRS hand held (At least 3 watts) with a detachable
antenna.
May not be aware of MURS.

>Also a ready made base station antenna and a magnet mobile mount.
Both, GMRS and MURS, are readily available.

>All legal.
No license required (MURS). How is the relative related. Will
licensing cost $80 or $160(GMRS)?

>Our need is urgent to help monitor a sick relative.
Time is important. No license required. Odds are (I may be wrong)
that there are fewer MURS users than GMRS in the area, resulting in
fewer people stepping on each other.

>My wife and I are complete novice's but thanks to this site I'm
more informed then I was two hours ago.
This guy doesn't sound as if he has a repeater or is about to
buy/build one. If he uses someone else's, he will have to share.
MURS is under-utilized in most places.

My intent is not to start anything. We could stand to use a bit more
info on it's usage, ie.: topography, range, structures, exact
relation, etc. I am sure that with some more info we could set this
guy up with a good system be it GMRS or MURS.

Topic: 11062 Message: 11072

None taken. Good point. That's why I gave him open options, but suggested to go simple with a few HT's and a mobile antenna. Which you can also get for pretty cheap as well.

The license may be an issue with his family, but the FCC ULS has come a long way since I joined back in 2001. So it should be easier to sign up and receive his temp license while his permanant license is being filed. I admit the $80 is a bit steep, but there are benefits to GMRS besides operating on simplex.

I am somewhat aware of MURS, but not too familiar on how it operates or what it requires to use it's system. I have noticed that some folks on here have MURS licenses. Is that from back when as well, and now is not required? Do you know of an info site about MURS besides another group that I could look up. I'd rather not join another group (5 is enough, plus mantaining 2 others as well and three businesses and two websites).

I filed for my GMRS license online at the ULS site. I did this about
3pm. My call sign was issued by the time I checked their website
when I got up for work at 3 am. 12 hour time. I figure filing online
more or less starts an automatic process.

I had my paper license in a week.

In some cases.
where?
RKLeef, Midland for $66, Columbia MURS2 on eBay(Not commercial, but easily modded for external antenna, Dakota Alert, and others.

But as I said before, we could use a bit more info about his usage.

11078. GMRS antennas

Yahoo group: GMRS (2005 — 2007)
Date: 2006-03-11 21:42:25 UTC
From: Bill
Topic: 11078 Message: 11078

Over the past several months I've read many posts answering complaints about the poor performance of "bubble pack" radios. And most of the answers say the antennas are the problem.

Hmmmm. While recovering a 440-470 mhz antenna from a GE MPD radio I decoded to make a comparison myself. I had one of those cheap Bellsouth 2 watt radios that had bad audio I had junked a couple days before. I took it apart to see how it was put together. Other than the wire inside being of different materials I believe the lengths are about the same.

Here's the specs as best as I could measure:

Bellsouth. Total length about 2.64", outside coil dia. .225" with 19 turns. Material appears to be steel with maybe zinc coating.

GE. Length 2.52", coil dia. .315", with 11.5 turns and .9" from the last turn to the tip which is inside the black plastic base. Material probably is copper or at least copper coated steel.

Someone do the math and give us your opinion/s! Oh, photos have been uploaded for your review.

GMRS radios found in the retail stores in bubble packs with FRS freqs have no removable antennas. Although you might be able to take them apart and modify the connection with a BNC connector. But then you' be voiding the warranty and violating FCC regs.

You can do a search for GMRS radios and find lots of sites selling "industrial" quality new radios. Most all of these have removable antennas but could be a SMA connector or other type other than BNC. But then adabtors are available.

And then you can go on eBay, click on Business/Industrial and follow links to radios and find lots of stuff that is better quality than a bubble pack. Problem is you need to send it to a tech for programming. But when your done you'll have a radio that can't be beat.

From: kevin asato
Topic: 11062 Message: 11083

Audiovox has base stations that are FRS/GMRS oriented
with fixed antennas. Remember, since part of
distance/reach is based on height above ground and
being in the clear, the antenna fixed to the base may
actually work against the user.

Looks like a SMA connector. Motorola makes these, and Radio Shack might carry adaptors. However, if you have a Ham Radio Outlet near you, they would definately have an adaptor or other antenna for your needs.

John
I believe what Jeff is refering to is
the Airwatch Traffic Network that supplys Highway
traffic info to radio stations across the country.
like Shadow traffic and Metro traffic.
Airwatch Traffic is part of the Jacor Broadcasting
company Under the Name Airwatch America Inc.
you can actually Contact the President of the company
and ask...
here is some info
"

COVINGTON, KY, November 24, 1997: Jacor
Communications, Inc. (Nasdaq: JCOR)
today promoted Earle Curtice to President of Airwatch
America, the company's Southern California based
traffic, news, weather, and sports network. In his
new role Curtice, a native of Southern California with
twenty years of broadcast experience, will continue to
develop new markets for Airwatch and
plans to expand its presence outside of the California
marketplace. According to Curtice, "Airwatch provides
an invaluable 'must have' service to radio and
television stations. With over 80 employees and a
full aviation fleet, we can provide a high quality,
affordable service with professional air talent at
significant savings. There's a huge market for
Airwatch's services across the country and we plan to
go after it. I appreciate the commitment and support
Bobby Lawrence and Jerry Kersting have for our
project."

Contact:
Pam Taylor
606.655.6523

Earle Curtice
President, Airwatch America
619.496.3900
BTW the ULS system has no records Of such a call
sign Nor any GMRS license by Airwatch America or its
parent Company Jacor broadcasting.

From: Duane Vincent
Topic: 11086 Message: 11097

The answer might simply be this: there is no prohibition against conducting business on GMRS frequencies PROVIDED that each person communicating must be individually licensed.

There are two exceptions to this:

a) the radio license is "grandfathered", i.e. the license was issued prior to the date of the change in FCC rules or

b) the individuals communicating are members of the same family.

Any frequency on the Duplex (467.xxx) you want, and make sure that you have CTCSS on your In/Out (TX/RX) so you don't interfere with the other repeaters.

You too can be on 19 or 22. This isn't like a business band where you're licensed to a specific frequency. Any of the 16 GMRS frequencies or 7 FRS you may talk on, and use a repeater on the GMRS 467.xxx.

ok True to a Point..
however I own several amateur repeaters. and I am a
broadcast Engineer.. I know for a fact that If I
placed my repeater On Either 19 or 22 with the other
repeaters. Even with DifferentCTCSS(PL tones)
than what they are running with FM you get capture
effect. it does not matter what CTCSS tones are being
Run. the stronger signal will lock out(capture) the
receiver. But Ok I will just pick one of the other
pairs to setup on. I just thought that with so few
Frequencys. that there would be some coordination
Between groups...

11100. Open repeater guide

Yahoo group: GMRS (2005 — 2007)
Date: 2006-03-14 22:31:28 UTC
From: Richard E. Ranson
Topic: 11100 Message: 11100

I put out on the list awhile back and got no feeedback on this. Would anyone support an open repeater guide even as simple as a word doc or excell spredsheet listing an individual repeater location (city) approximate coverage area (ie 5 miles radius, etc) frequencies and PL/DPL codes and if its open or closed? It might be beneficial for those persons that travel cross country and want to keep in contact better than just simplex range while visiting in a city?

Just my thoughts

Rich Ranson

Topic: 11098 Message: 11101

Neal, There are coordination groups in the US, but it depends where you're at. Some cities our areas have them, while others don't. GMRS doesn't run like the ARRL does, so your original concept of how a repeater works on GMRS doesn't necessarily work in that way.

As for the stronger signal taking over other repeaters, that has never happened in my experience within GMRS. Because we're limited to 50 watts and our systems are so far spaced out, it rarely happens. And when it does, the owners usually work together to solve the issue.

In the Bay Area in California, our systems are close, yet far apart enough where we don't have this problem. We also only have 2-3 systems on one frequency, and mantain CTCSS control within these systems for an overall achievement of coverage. Now if someone wanted to use a frequency that was already being used, and say I had a tone that was dormant, I'd work with him and may let him use that tone with his system, but I'm still operating on the other 15 or so tones within that frequency.

We have to work like a network, even though we can't link or use voting systems. REACT and other groups in the area have several systems that they own on different mountain tops, and they use them accordingly to what they need for their events, etc. Private owners and families also have several systems to achieve the same concept. Although we'd like it very much to be the same as the ARS, it'll never happen...

So, I think I wrote enough for now. Kinda got a bit carried away, but you get the idea... =c)

Anyhow, that is why we have seperate tones, and most don't overhear other systems or have stronger signals. Us repeater owers hate that anyways. We love to use filters, etc to manage this. Not getting on your case... Just clarifying. General info here...

11103. Violations with RUG..on 462.675 Monday night net.

Yahoo group: GMRS (2005 — 2007)
Date: 2006-03-15 20:59:00 UTC
From: Roger Lincoln
Topic: 11103 Message: 11103

A formal complaint is going to filed against RUG (Repeaters Users Group) and Ham Call N6MEL.. here in SOCAL. Last Monday night they held the REACT check in net. They had 2 HAMS check in using their HAM call signs. The Orange County Chapter of the RED Cross checked in without using a GMRS Call...the person that checked in was N6MEL who is supposed to be a Disaster communicator for the ARC, he should know better. This happens all the time with these guys. They preach the rules but don't follow them. And Ed Greany you should be ashamed of your self!!! REACT V.P.???HA! this is typical of RUG mainly Crest Communications...they also actively promote the use of modified HAM gear..and I bet N6MEL checked in on a modified radio. The CREST trailer or Ed's toybox also has a modified HAM radio in it...I saw it myself...what a bunch of hypocrites!!!

Roger --- GET A LIFE.

It was a Red Cross disaster training exercise. They clearly said who they were. The Red Cross DOES have a license... the op just didn't have it handy.

No harm was done. Don't you have better things to do with your time?

==========

YEAH YEAH YEAH BLAH BLAH BLAH...

Roger -- you either need to read the rules or get another hobby.

The RACES trucks also have properly licensed ham radios operating
outside the ham bands. Sheriff's vehicles, MARS and the National
Guard have ham radios used for the same purpose -- disaster communications.

READ BELOW...

S 97.111 Authorized transmissions.
(a) An amateur station may transmit the following types of two-way
communications:
(2) Transmissions necessary to exchange messages with a station in
another FCC-regulated service while providing emergency communications

From: Lake Hodges Radio
Topic: 11106 Message: 11106

Cc: Riley Hollingsworth <Riley.Hollingsworth@...>

Roger --- Please be sure to include your mailing address and contact information when you make that complaint. Maybe you can also complain about the person (with NO call sign and NO legal ID) who broke into the Monday Night net and interrupted the Red Cross person. As a matter of fact, the comments made on the air by that person were very similar to what you wrote (bottom of this page).

Now that's an interesting coincidence, isn't it?

Several us have also noticed that the FCC database does not have a record of any license (Ham or GMRS) for anyone named Roger Lincoln in the state of California. You wouldn't happen to be using a GMRS radio without a license, would you Roger?

Or... is your name not really Roger Lincoln?

11107. Re: [GMRS] HAM Radio Use in Emergencies...

Yahoo group: GMRS (2005 — 2007)
Date: 2006-03-15 22:15:24 UTC
From: Blake Bowers
Topic: 11103 Message: 11107

Uh, yeah.

The FCC has shown and stated, that use of modified
radios as a preplanned method of communications is
NOT legal, if the radio is not accepted/certified for the
service it has been modified in.

The guy is right - if this was a drill, then the proper rules
should be followed. Proper ID, proper radios, etc.

HAM licenses are not valid for GMRS, and any exception
for a dire emergency does not qualify during a drill.

If the Red Cross cannot find their call, or use their
call, they should not use the radios (Except of course
in the case of a dire emergency)

Ask Riley about the use of modified HAM radios as a normal
method of communications for drills, and emergencies. You
will be very surprised what he says.

Karl Bingert, Chief
Bon Secour Fire & Rescue
Bon Secour, AL 36535
RE: Advisory Notice--Use of Non-Certified Equipment for Public Safety Communications; Case #EB-2002-437
Dear Chief Bingert:
Information has come to our attention that your department may be using ICOM IC-V8 Amateur Radio Service 2-meter hand-held radio units that have been modified to operate on fire department frequencies. Please be advised that all equipment used in the public safety service must be certified by the Commission and each unit must bear a certification label. The use of Amateur Radio units of any kind, modified to operate on your frequencies, would be against the Commission's rules and would result in enforcement action by the Commission.
You may call me at 717-338-2502 if you have any questions about this inquiry.

You're right and no one disagrees with you.

In this situation the Red Cross operator signed off as soon as he realized that he didn't have the Red Cross GMRS license on his person. Everyone on the net knew exactly who he was. When he realized that he didn't have the GMRS call sign, he gave his ham call sign to identify himself and it was made clear that he would get the Red Cross GMRS call sign before resuming operation. It was nothing more than an honest oversight by a well-meaning emergency services volunteer. This was certainly NOT a situation that needs to be reported to or acted upon by the FCC.

Now let's get down to full disclosure here...

The unidentified (and most probably) unlicensed breaker who came on the air to harass the Red Cross operator was much more of an offender. And that is probably the same person who made the complaint on the Yahoo Group using a purposely fictitious name to cloak his own identify. And we think that the same person has a bone to pick with the repeater owner because the repeater owner has declined to allow him to use the repeater without a GMRS license and without contributing to the cost of the repeater.

Jeesh...

11113. Monday Night's Net

Yahoo group: GMRS (2005 — 2007)
Date: 2006-03-16 17:31:07 UTC
From: Craig Konrad
Topic: 11113 Message: 11113

Being both a ham (kf6nfd) and a GMRS license holder (wpwn332) I have been a member of this group for a while. I also am a volunteer with the Orange Co. Red Cross and passed the concerns of some people here to Mel (n6mel) and wanted to pass back to the group his response.

Also for those that might be concerned the Orange County Red Cross GMRS call sign is KAD6329.

Craig Konrad
KF6NFDMonday Night
WPWN332

P.S. Hopefully we can all now let this go.

To whom it may concern;
I wanted to apologize for what was described as breaking protocol during the REACT training net Monday. American Red Cross has a long standing Memo of Understanding with Crest REACT in compliance with FCC guidelines.

While we would always want to use radio type call sign, it is acceptable during disasters and training to ID as ¡§Orange County American Red Cross¡¨. It is my understanding that CREST Officers are issuing a REACT call sign to Red Cross.

We value the relationship between Orange County American Red Cross and CREST REACT emergency communication team who demonstrated their readiness and capabilities during the recent Sierra Wildfire. There to help the hundreds of people evacuated.

Contrary to comments made by Mr. Lincoln, Am Red Cross radios are type approved. Our radio include all levels of government, hospital, military, MARS, GMRS, ham, and commercial radio services

Orange County American Red Cross works very closely with the Southern California Field Office of the FCC and have informed them of the formal complaint by Mr. Roger Lincoln. OC American Red Cross recently joined with the FCC, FBI and US District Attorney in a radio interference case.

We appreciate the hard work CREST REAC Emergency Communications team has made with outstanding repeater system and trained communicators. Orange County American Red Cross will count on CREST REACT in times of disaster.

Regards,
Mel Goldberg, N6MEL - OPS 9644

From: Lake Hodges Radio
Topic: 11113 Message: 11115

Gentlemen,

Your message (see text below) is a touch of class. However, it's not really necessary.

The writer who complained on this Yahoo group (aka Roger Lincoln) is a rogue and an email flamer and has no legitimate right to complain. He is like the proverbial pot calling the kettle black.

From what we can tell, Roger Lincoln is a fictitious name used deliberately to cloak his true identity. He has also used the name Roger Boutlander in various Yahoo Groups in the past, and it appears that name may also be a false identity. From what we can tell, he does not have a ham license or a GMRS license, so one has to wonder whether he is using the airwaves in violation of FCC licensing rules.

Previously, he was looking around for GMRS repeaters in Southern California that he could use for his personal use -- perhaps he is still trying. He has never provided any evidence of having a GMRS license.

There are many similarities between what "Roger Lincoln" posted on this Yahoo group and what was transmitted during the net last Monday by an unidentified and probable unlicensed station. One must wonder whether he is indeed the unidentified breaker who rudely interrupted the Net on Monday in a blatant violation of FCC licensing rules.

Tracking the history of his email address -- orcoscan@... -- one can see that he has caused trouble for other Yahoo Groups and has been banned from some of those groups. The Yahoo record for orcoscan@... includes the following: Real Name: Roger Boutlander, Nickname: Boots, Location: Orange County, CA, Age: 56, Occupation: Retired Fire Captain, Hobbies: Gardening, Monitoring Public Safety Frequencies. It also appears that he may have some connection with (or some interest in) either the Los Angeles or Riverside fire departments. Maybe just a scanner listener, maybe more.

Gentlemen... your service to the community is respected and appreciated. On behalf of everyone who benefits from your services, you deserve a special thanks for the great work that you are doing. Stay the course!

The unwarranted and unreasonable complaint by "Roger Lincoln" should be closed and forgotten.

Good luck!

The only person who ever claimed that anyone was using modded ham gear was Roger Lincoln, which is a fictitious name used by someone who does not appear to have a GMRS license or a ham license.

The Red Cross has denied the claims made by "Roger Lincoln" (aka Roger Boutlander) and stated that they are only using certified radios.

You're making an issue of something that never happened.

I think we ought to drop this subject.

Wonderful. "revenge" attacks.

Well.. if he files his complaint, and it is false, he will then
himself be subject to investigation.

>

Above is where you state that they have RACES trucks with ham radios
operating out side the ham bands, as well as the SO, MARS.

No mention was made of the Red Cross here, by either party.

YET,

Here you state,

"The only person who ever claimed that anyone was using modded ham
gear was Roger Lincoln, which is a fictitious name used by someone
who does not appear to have a GMRS license or a ham license."

So what is the real story? You seem to contridict yourself here.

11123. HAM Radio Use in Emergencies...

Just as it appears to outsiders, you seem to be
hiding a lot.

IMHO, of course.

If you can't answer the question.... Anyways, not
knowing which question you are not answering, one
of the two was a simple request for education. Does,
or does not the ARC need to properly ID, or can they
just say they are the ARC during a drill?

I am just trying to get educated here. If they need to,
then you need to educate them, if not, educate me!

Give it a rest. Nothing is being hidden. This is not an appropriate discussion any more.

Nothing bad happened. This was blown WAY out of proportion by an apparently unlicensed rogue using a fictitious name on Yahoo who has his own hidden agenda.

Now let's drop it. Case Closed...

From: Blake Bowers
Topic: 11103 Message: 11126

And who are you to decide if it is appropiate or not? Last I
checked, you were neither the moderator nor the owner of
this list. I am sure if my posts step over the limit, I will be
recieving a private note from the moderator or owner, and they know
I will comply with their wishes. I suspect they are sitting back,
letting this run its course, as at least on my end, there are no
tempers flaring, no bashing, just thought out reasoning.

Proper operation of GMRS radios by anyone - not
limited to REACT, or any club, person, etc, is an
important part of GMRS, and should most certainly
be an appropiate issue.

Whether or not the original poster is,
A, Unlicensed
B, jamming nets
C, just a big old bully
Has not been proven, and is pretty much just conjecture on
your part.

What is clear,

1. There were issues with the net - everyone admits that.
2. In emergency services out there, there are people using
modified radios in contradiction to the FCC rules
3. The American Red Cross has some confusion about
proper ID'ng anyways.

Now these are things that you have either posted, or agreed to
in the posting.

The fourth item I would consider is that CREST REACT might
do better if they approached their damage control with forethought,
instead of defensiveness.

Honesty goes a long way. Telling everyone to "drop it" smacks
of covering things up.

Topic: 11128 Message: 11128

Looks like I definitly struck a nerve again. What I have posted here is the absolute truth. I'm not hiding anything. As you all can see, those that do hide things and try to rationalize illegal activity are the one's that are most defensive., ie ..Ed, and now the self apointed moderator of this and many other groups, N6MD, Lake Hodges Radio..Kurt Barnhart. BTW do you notice how Kurt likes to take control of the subject line in the reply posts by removing the "RE" this is his way of trying to control the issue. And for weather I'm licensed to use GMRS no I'm not...but you that preach the rules know that I can use the license of an immediate family member that lives under my roof!!! Facts are facts and some involved in the hierarchy of RUG don't like to be exposed for who they really are. Don't get me wrong, there are some good people involved in RUG and REACT, they are just no in the loop of what really goes on and what has been going on behind closed doors in this corrupt organization for years. As for them being an emergency communications organization...ha.. only with themselves. There is not one public entity (government) that I am aware of in the region that has them in their emergency plan. I know a lot of regional communication people and they think REACT is a joke. REACT still has the stigma of a fat CB trucker trailer trash type person and to be honest alot of them are still that way. So keep lying on renewal applications on transmitter locations to preserve your "grandfathered licenses" keep putting others in jepordy of loosing their licenses and fines. And keep up trying to manipulate the rules to favor your own agenda...I don't have to prove anything to RUG

Relax. Yahoo! Mail virus scanning helps detect nasty viruses!

A GMRS license is $80 for 5 years. A GMRS license is the same whether
you have a repeater or just use a handheld radio. A GMRS license is
required any time you use any radio on any gmrs frequency.

GMRS license is the same for all GMRS use. It covers all operation that occurs on GMRS frequencies whether it is from handheld to handheld, base or repeater use.

Canada has a license free 2 watt GMRS radio service. If you are in
Canada and operating with an Indusctry Canada certified GMRS or
GMRS/FRS hybrid radio you will not need a license for that hand held
radio.

If you are in the United States, even with an inexpensive hand held
radio from one of the discount stores, you will need a license at a
cost of $80 every five years. That license will allow you and your
immediate family members to operate hand held radios, mobiles, base
stations and repeaters at up to 50 watts output power.

Instructions for obtaining you rlicense can be found at -
www.popularwireless.com/gmrslicense.html

Bobby,

The FCC GMRS license costs $80 and covers you and your immediate family for the first five years. To renew your license, there will be a small fee attached, which covers the next few years, and so on. This license allows you to operate a handheld (HT) radio, mobile radio, base radio, and even a repeater station/system. Many people ask if you need a seperate license to own your personal repeater system. The answer is no. One callsign/license covers every operation and equipment that you own for the General Mobile Radio Service (GMRS), per FCC Part 95.

Not sure what you mean by linking, but you may not link the GMRS service to any other radio service, or link a GMRS repeater to another GMRS repeater or other radio service repeater. We've had discussions about this in past posts, as the FCC rules are unclear. I recommend to either write or call your local FCC office for help on this topic, or just enjoy the current benefits that GMRS has to offer.

Hope this has answered your questions. If you have any others, we'll be here to help and answer them for you.

73,

I wonder how you are planning to comply with the type acceptance requirement, limited of .5 watts ERP, non-removable antenna, etc. But of course you¹ll be saving $16/year provided of course you don¹t get a visit from the FCC. Have you really thought-out this grand scheme of yours?

Topic: 11132 Message: 11144

Hey Ryan

Newby here, I just bought one of those FRS/GMRS Motorola hand bubble packed held radios from Target... do I need to purchase a license too? I think the radio puts out 1 watt. I can't imagine that all those people buying one of these off the shelf radios are paying the FCC $80 for a license.

Also, what kind of performance can I expect from this radio?

Thanks!

~ Frank

kvsp1160@... wrote:
Bobby,

The FCC GMRS license costs $80 and covers you and your immediate family for the first five years. To renew your license, there will be a small fee attached, which covers the next few years, and so on. This license allows you to operate a handheld (HT) radio, mobile radio, base radio, and even a repeater station/system. Many people ask if you need a seperate license to own your personal repeater system. The answer is no. One callsign/license covers every operation and equipment that you own for the General Mobile Radio Service (GMRS), per FCC Part 95.

Not sure what you mean by linking, but you may not link the GMRS service to any other radio service, or link a GMRS repeater to another GMRS repeater or other radio service repeater. We've had discussions about this in past posts, as the FCC rules are unclear. I recommend to either write or call your local FCC office for help on this topic, or just enjoy the current benefits that GMRS has to offer.

Hope this has answered your questions. If you have any others, we'll be here to help and answer them for you.

73,
Ryan

if you're on a gmrs frequency, you need a license, only 1 license and it's $80 there is no hand held one, repeater one, stuff like that. If you have an FRS radio then you don't need a license but if it's a FRS'GMRS radio, then for channels 1-7 you will. I'm sure that changes if you have hand holds like the ones I have in my emergency kit which I can put the power at FRS settings on those channels, as long as you use only that setting but I'm getting too confusing for so early in the morning.

>FCC $80 for a license. Also, what kind of performance can I expect
>from this radio?

Hi Frank,

Depending on what radio you bought, you are probably transmitting between one and three watts on the GMRS channels and one-half watt on the FRS-only channels.

The FRS-only channels are channels 8 to 14 and you do NOT need a license to operate on those channels.

Channels 1-7 are shared by the FRS and GMRS services. Since your radio probably transmits more than one-half watt on those channels, you DO need to have a GMRS license to stay legal.

Channels 15 to 22 are GMRS-only channels. You cannot transmit anything on those channels unless you have a GMRS license (if you want to follow the FCC rules).

See below (bottom of this page) for a table of FRS and GMRS frequencies.

What kind of performance can you expect? In a large city you might get a mile outdoors on the FRS channels. Probably less when you're indoors. In Suburban and rural areas, your range could be as much as 2-4 miles on FRS and a little more on the GMRS channels, where you radio has a higher power output. The range claimed on the box (some say five miles, some say more) is probably true only when you're in an open field with no obstacles. FRS and GMRS operate on UHF in the 462 / 467 MHz range and these signals are line-of-sight.

We have a 5,000 foot mountain here in San Diego. From the top of the mountain, we can talk 30 to 50 miles with a watt or less. That's because we can see 30 to 50 miles.

With a different kind of GMRS radio (not the ones from Target) you can get a range of 20 to 100 miles by using repeater stations on channels 15 to 22. This usually requires that you contribute to the cost of operating the GMRS repeater. On the other hand, HAM repeaters are usually free. More on repeaters later...

Why does the FCC charge $80 to use a $25 radio from Target? It's a long convoluted story involving special interests (radio manufacturers and large users of UHF frequencies), radio spectrum politics, and a desire by the government to collect money from as many people as are willing to pay them.

Is this crazy? Yep. But don't bother complaining to the FCC. Write your congress members and Senators and members of the various FCC and communications oversight committees. Recognize that this is a complicated matter with many differing opinions (some of which will probably be posted as responses to this message).

FRS was intended for family members to talk over short distances of a mile or so. That's why the power is limited and the radios are around $25 each.

GMRS works best for families and groups of people who are willing to spend some money for good radios, antennas and possibly a repeater. Cost: $300 to $3,000.

If you want to use two-way radios in a more serious way, consider getting your Ham license.
You, your wife and your kids can all get ham licenses.

It's easy to do -- a 10-year old in my area just got his license. Morse code is NOT required for the entry level license. A Ham license will cost you between $5 and $10 and there are thousands of Ham repeaters that you can use at no cost. I have talked as far as Japan and Israel on Ham repeaters that are linked over IP networks. You cannot do this on GMRS because GMRS repeaters cannot be linked.

Topic: 11132 Message: 11154

Hi Frank,

First off, let's put this into perspective of the radio manufacturers claims (on the packaging) vs what GMRS is really all about. And then consider the $80 for your license...

The bubblepacks (as we like to call them) that you see in stores claim that they have .5, 1, 2, and even 5 watts of power! They can transmit and receive as far as "up to" 7 miles!! This is all very true, if you're in Death Valley or the Sahara Desert. Most bubblepacks these days have FRS/GMRS capabilities and do not have access to repeater systems, use cheap components, and are used in the city or near buildings and trees or crowded areas. FRS/GMRS is also on UHF (Ultra-High-Frequency), and the signals take longer to penetrate through solid structures, or not at all.

Commercial radios such as Motorola (the higher end), Icom, Kenwood, GE, Midland (higher end), and others have components that can handle the 4 or 5 watts for GMRS (no FRS here), or the full 50 watts if you choose, for either HT's or mobile applications. They give you choices to use them for simplex or duplex (repeater) operations, and have more benefits that come with GMRS.

Now let's look at the $80 you have to spend for that stupid, worthless license. Why do you need to spend $80 for a $15 toy? Most don't and still talk on the GMRS frequencies, and even on our repeater output frequencies. Some even get caught and are fined by the FCC with up to (and sometimes over) $500. Why not expand and get higher quality gear for your money. Longer distance, higher quality, more power, better communications, and benefits for the entire family and community.

GMRS is not just a toy with noises like CB, it a whole other world (almost like amateur radio). It's a place to learn and a place to grow and experience the joy of Radio Communication.

Hope that helped. If not, do let me/us know and we'll answer you again. 73!

GMRS repeater question. Where are they in NE IL? Are they open to anyone for use? Does anyone have a list of repeater owners for NE IL? I am intersted in obtaining a license, but a little confused by the lawer jargon in the FCC rules/reg's. It appears as if anyone can put up a repeater on any GMRS freq as long as you have the GMRS license (standard mobile/portable license). Can anyone explain more on this. Thank's Jon.

Jon,

Check out www.laggroup.com for existing repeaters in the area. As a
GMRS licensee, you may put up a repeater on any of the 8 pair of
frequencies. Just remember to try and coordinate tones with other
repeater owners in the area. Our site explains things in better
perspective.

Hope this helps!

Jon,

Correct on everything! With your very own $80 GMRS license, issued by the FCC, you can put up a repeater on any given frequency. Mind you that you're not stepping on anyone else's toes. So listen to the frequency first and stick a CTCSS on there as well.

The $80 license can be obtained by using the old method of the postal service, or the FCC's somewhat accurate online Universal Licensing System (ULS). For most, it's quick, easy, and you can receive your license in a few weeks or shorter. Or use the handy "605 - Schedule F" form for your temporary 90-day license while you wait for your current license to be filed.

can be an SO239 where you'd need a PL 259 to connect with it, some are N connectors, I've seen some that were mini PL259 q mainly has those, not sure what else but I'm sure there are others out there.

Use the online application process for GMRS licensing. Takes about
10-15 minutes. I've seen license turnaround times less than 24 hours,
just helped a guy out the other day, was in the database in 11 hours.

For the male, it's a PL-259. For a female, it's a SO-239. Both are UHF-type connectors. Can be used for any band or frequency. Can be bought at your local Radio Shack or other radio shop for a few bucks.

The uhf connectors are

PL-259 male (on antenna cable)
SO-239 female (on radio chassis).

Depends on the type of radio. I know that Icom favors the UHF (f),
Kenwood favors the "N" (f), and Motorola favors the mini-UHF (f).

And yes, UHF connectors come in both Male & Female type (as does all coax
connectors), other wise they couldn't "connect".

Usually a week or two. One reported 11 days, and another in 6 days. You should receive an email, but the FCC always sends your license through the USPS on a letterhead with your callsign and other information about the license. Keep the envelope and license in your office, at home. Or at your radio station where you have your radio equipment. Don't loose it.

1 watt, 2w, or 4w, it doesn't matter. FRS/GMRS radios will handle malls very well. It's the distance in cities, in vehicles on highways, from home to vehicle, etc that will loose the signal because of trees and buildings. Malls are open-spaced and the walls aren't that thick. Most use glass for windows, and columns for supports, so it allows the signals to either bounce off, go around or go thru the object. I'd however get your license and stick to GMRS because many people use FRS in crowded areas more than GMRS.

I have the Motorola T6400 (excellent stuff), but I hear that the Motorola T7200 is good as well, as they have access to the GMRS duplex channels too.

From: Duane Vincent
Topic: 11180 Message: 11181

I use a Radial/Larsen NMO 2/70 antenna. It is 34" tall.

Mounting of antennas is a personal preference, often dictated by the vehicle involved. A magnetic mount is often used; however, be aware of the very real possibility of scratching the top of the vehicle should the magnetic mount move.

Other methods of antenna mounting include:
a) drilling a hole in the top of the roof, or the trunk lid;
b) a fender lip mount;
c) a trunk lip mount (the way my antenna is mounted).

The very best antenna placement would be in the very middle of the roof.

One thing to be very concerned about: placement of the fuses in the radio power supply cord. Some manufacturers have chosen to place the fuse(s) near the radio. THIS RESULTS IN A FIRE DANGER. The radio needs to be fused NEAR THE BATTERY. The reason is quite simple: fraying of the radio power supply cord will cause a short to ground. A short will cause a fire. Why risk loss of an expensive vehicle by not fusing the power supply cord at the battery?

Thanks Ryan,

Yea I was thinking of putting a label with the call letters on the hand held radio itself. and also adding a suffix "-A" or "-B" so that I can tell which radio is witch. I also have a handheld marine VHF radio with built in FRS and GMSR receiver/transmitter built in. It's an iCom, pretty nice little radio. Bought it for marine use.

In reply to the magnet antenna: I use a magnet mount on my truck, but it has a thin layer of vinal protection on the bottom of it so the magnet does not scratch the roof or paint. Still holds. Here's what I bought:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=9704298922&ssPageName=MERC_VIC_RSCC_Pr4_PcY_BIN_Stores_IT

They still have 5 left. The antenna is 27" overall in height, has a 300w max input, 14ft low-loss RG58A/U 98% shielded coax cable, 5dB gain, and NMO mount with included magnet mount.

All great for a price of $26.95 plus S&H. I use it with my Icom F-420 mobile radio.

Another note about the fuses and supply cord that Duane was mentioning... I'm guessing he's saying this if they're old or unprotected and have bare connections or wires.

I didn't have the power cables that came with my radios, so I build my own fuse box and wire fox tail (where the wires come out of the fuse box and split off to their cooresponding radios). Yes, the box is behind the radios, but I also have other accessories connected directly to my battery, besides the radios.

Yes, I should be going through the alternator, but that's where you get the engine noise and grounding loops from as well.

So why did I choose to put the box next to the radios vs next to the battery? Simple. I wanted to keep the ground loops and noise away from the engine compartment as much as possible. Not only do I have GMRS with me but I also monitor CB on occasion and had to install ferrite cores on it's lines.

I thought I'd tell you this cause it didn't make too much sense to me to put the fuse box next to the battery. Ground loops, engine noise, heat, etc. All elements that can cause interruption in your radio system. If your radios are inside your armrest, under your console, in your console, or some people put them in their glove box, put the fuse box behind the console or behind the AM/FM radio. A place where it stays cool and air flows thru it easily during the summer and stays comfortable during the winter (not freeze up). Ferrite caps, cores, or beads can be purchased at Radio Shack or your local radio shop for a few bucks, and will work wonders to save you from ground loops and engine noise. They work even better than the built in noise blockers that radio manufacters add in their radios.

Enough here for now. 73,

Frank,

I wouldn't necessarily modify the callsign, but you can do something like this:

"This is WPAA123, Handheld 1 calling handheld 2. Are you there? (do you copy)"

OR

"This is WPAA123, Handheld 1 calling mobile 1. Are you there? (do you copy)"

There are many different ways of using your radios within your family with one callsign. Make up names or handles (mobile 1, mobile 2, base 1, 1526, 1527, etc). In a CB organization that I managed, we used created callsigns: KPBZ2117, KPBZ2125, KPBZ2197, KPBZ2192, etc. We had over a dozen members with just those call letters, and they almost were identical to the original CB callsigns that the FCC used to assign to people.

GMRS uses only two configurations for callsigns:

3 letters by 4 numbers: KAA1234 (3x4)
4 letters by 3 numbers: WPAA123 (4x3)

So if you use a different configuration that doesn't resemble GMRS callsigns, then go fo it. But always remember to use your given FCC-issued GMRS callsign to sign on and sign off of the air. Most forget and get in trouble for that.

Ryan writes: "Another note about the fuses and supply cord that Duane was mentioning... I'm guessing he's saying this if they're old or unprotected and have bare connections or wires."

Ryan, these ICOM cables are no more than 3 years old - and it was the recommendation of the commercial radio shop that the fuses be placed close to the battery to eliminate the chance of fire. With the gauge of wire used in the power cable, it would surely cause some significant damage should a short occur because of a frayed wire where there was no current protection. I'll defer to the judgement of the professionals on this one.

"14ft low-loss RG58A/U 98% shielded coax cable"

While short runs of RG58A/U are acceptable for mobile work, that coax is not acceptable for longer runs - for that, I use RG8X coax. The loss specifications for RG8X coax at VHF/UHF frequencies are much better than RG58A/U.

Topic: 11180 Message: 11189

I guess I'm just confused why a user would use a cable that is frayed to begin with, or use a cable that would start to fray. Then I can see why they would say that.

I use 240v, 18-20 ga. cable for my power feeds, with the manufacturer-reccommended fuse ratings. Even though you're only supplying the radio with 12-14
volts of power, I went the extra mile of protecting my equipment. That's all I was saying.

The other problem I had with putting your feedlines near the engine or it's compartment, was associated engine noise. Fuses act as a resonance attractant when near other electrical fields and noise from the engine, magnetic areas, and batteries (connected to the alternator) can cause ground loops and noise. So keeping your fuse panels away from that area gives you a higher chance of less noise and less ground loops, etc.

I'm not disagreeing with what you were saying, just a bit confused on those two statements. Hope we both understand each other now.

From: Duane Vincent
Topic: 11180 Message: 11191

Ryan writes: "I guess I'm just confused why a user would use a cable that is frayed to begin with, or use a cable that would start to fray. Then I can see why they would say that. I use 240v, 18-20 ga. cable for my power feeds, with manufacturer-reccommended fuse ratings."

Ryan, any power cord is subject to wear and damage, which is why fusing should occur as close to the power source as possible. Fuse near the power source to minimize the chance of fire.

Your ICOM IC-F420 is rated at 8 amps current consumption (source: ICOM America). That requires a MINIMUM of 18 gauge wire, and I suspect that your current cable made up of "18-20" gauge wire is closer to 20 gauge than 18.

I guess I'm just confused why a user would use a cable that is frayed to begin with, or use a cable that would start to fray. Then I can see why they would say that.

I use 240v, 18-20 ga. cable for my power feeds, with the manufacturer-reccommended fuse ratings. Even though you're only supplying the radio with 12-14
volts of power, I went the extra mile of protecting my equipment. That's all I was saying.

The other problem I had with putting your feedlines near the engine or it's compartment, was associated engine noise. Fuses act as a resonance attractant when near other electrical fields and noise from the engine, magnetic areas, and batteries (connected to the alternator) can cause ground loops and noise. So keeping your fuse panels away from that area gives you a higher chance of less noise and less ground loops, etc.

I'm not disagreeing with what you were saying, just a bit confused on those two statements. Hope we both understand each other now.

And I don't understand how moving the fusebox from the battery to near the radios eliminates any "ground loops". You still have to have at least one wire from the battery (in the engine compartment) to the master fuse box. Noise doesn't really care how it gets into the system, before or after the fuse. Any electrician (including me) will tell you that protection (fuses) near the power source protect the conductors going to the load and protect the source (battery) from a fault. A second fuse (slightly lower rating than the main, but more than normal radio draw) protects the radio. The battery is actually the best place to run power from, anyway. It acts as a filter for any power line noise (similar to a filter capacitor) and allows you to run equipment with the engine off. Just remember to turn off all the equipment before leaving so as not to have a dead battery the next morning.

Remember, wire gauge and diameter are in reverse relationship. The smaller the gauge, the larger the current carrying capability. Therefore, if the mininum recommended gauge is 18, the next size that you should use is 16. One should not go smaller as you can starve the radio of current or heat up the wires so as to cause a breakdown in the conductors and/or possible fire.

(Off the top of my head (and its fuzzy), I think 20 gauge is recommended to carry no more than 5 amps or current.)

11195. RE:Mobile Antenna

Yahoo group: GMRS (2005 — 2007)
Date: 2006-03-28 20:26:17 UTC
From: Richard E. Ranson
Topic: 5994 Message: 11195

Depending on your geography, I suggest a couple options. For urban environmentd with lots of buildings and obstructions you will see little benefit from a gain antenna such as Antenex B4505C. A phantom 3db gain uses knife edge refraction and works best in this environment. In a rural setting or less dense area, I would suggest the B4505c which offers 5db gain. or a B4503 which is 3db gain and about 16" or so (i use this on my explorer so it clears the garage doorr) specs on www.antenex.com I have an account with them and can order for anyone interested at a discount over their list price. The best ground plane is achieved by drilling a hole in the center of the roof of our vehicle. Magnetic mounts offer flexibility, but be prepared to have to replace them every few years or at least replace the coax is it gets damaged getting banged by teh car door, etc.

11196. Looking for cheap gmrs portable radio's (pair for under $100) that will do DCS

Yahoo group: GMRS (2005 — 2007)
Date: 2006-03-28 23:09:16 UTC
From: wcj64
Topic: 11196 Message: 11196

It appears as if all the "discount store" portables (motorola, midland, uniden, etc) only have the "38 privacy codes". I am assuming this is the standard CTCSS list. Are there radio's that will do DCS or do I have to buy a commercial or Ham radio that will do this. Some GMRS repeater's in my area have DCS codes for the input. Thank you. Jon.

11197. Re: Looking for cheap gmrs portable radio's (pair for under $100) that will do DCS

First, most radios available at the discount stores (bubble packs) will not access a repeater
and none of them that I know of are capable of DCS. You are right that the '38 privacy codes' are indeed standard CTCSS but again, they will only be useful on simplex (radio to radio on a single frequency). Repeaters use a duplex system that allows input on one frequency and retransmission on another.
Secondly, avoid using ham radios on GMRS frequencies. GMRS radios must be FCC type accepted. Most modified ham equipment capable of working on GMRS freqs. would not fall into this catagory and would be illegal to operate on GMRS.
A license for GMRS legal use is 80.00 for 5 years. All members of the licensees family may use GMRS under the same license.
For more info on rules and regs and licensing for GMRS, visit:
http://wireless.fcc.gov/services/index.htm?job=service_home&id=general_mobile
If you want radios that work on GMRS repeaters with CTCSS and DCS tones start looking for commercial radios such as motorola, kenwood, etc.
Hope this helps,
Ric B.

> Can someone recommend a good powerful mobile antenna.

One thing is guaranteed: ANY mag mount WILL scratch your vehicle. It makes no difference how the base is made...In six months, you'll have a ring of scratch mark around the circumference of your mag mount's base.

There are mounting systems that "clip" onto a trunk or hatchback up to 1/4" in thickness. Many use these very successfully.

What kind of car do you have? Are you needed a GMRS-only antenna...or do you work other services as well?

Topic: 11180 Message: 11199

The wires that come out of the F420 are 20 ga, and mine are 18 ga. The main feed from the battery are 16 ga. The PDF manual that I got online from Icom said to use 20A fuses. Not 8A, which I tried to use at one point from another source, and they popped. The F420 is a 35 watt mobile rig that has a higher power consumption than most would think. And now that I think of it, I'm actually surpriced that Icom would add 20 ga wire to the chassis, rather than a bit bigger wire.

I understand what you're saying about everying. I've been wiring electrical parts in vehicles and audio equipment for a long time now, so I took extra precautions when I built and installed my own fuse system in my vehicle. But the idea will be remembered for later use if needed.

No worries... 73.

If you have problems with the coax and the car door, why not push the coax into the weather stripping, so that it sits between the rubber and the frame. It not only protects the coax, but stays out of the way, and you can run your coax from the top of the roof to the bottom and into the door. The rubber acts as a cusion when the door closes.

I have a Ford Explorer XLT, and run the coax thru the back door, between the weather stripping and the body frame. Works great. I can take a pic if you'd like, and send it to you.

The rest of the run is easy, as I hide it in the plastic lining in the floor and up through the steering console to the center console. Bought used cubby holders and cut them out to install my radios. Fits nicely for any size radio. Room for 2-4 mobile units, and still have space for your drinks and A/C controls.

Except for my /\/\ commercial stuff, I've standardized on 12 guage wire and Anderson 30 Amp Power Pole connectors (Google that). That lets me prewire all my vehicles and move radios around at will. Hams are starting to use this wiring arrangement in incident response trailers/trucks, so that anybody's radio can be run in them.

Topic: 11180 Message: 11207

I bought mine at powerwerx.

<http://www.powerwerx.com/product.asp?ProdID=3016&CtgID=3014>

And don't forget to buy a crimp tool.

Walter

Not an answer to your question, but some GMRS history.

The Disney World Monorails used to use 462.675. I was in Dade County REACT back in the mid 1970's with our Carrier Squelch repeater in Miami On a couple cold nights a year the monorails would come in. "monorail brown to the switchbeam" would wake me up in the middle of the night.

This was back when organizations were eligible for GMRS licenses. If they kept renewing it, it might even still be on the air.

John and others ? Currently the repeater in Orlando is still down due to a lighting storm a year ago. There was a gentlemen who

said he was willing to take a look at it, but I lost the email. If he is still is on I would like to talk to him still. Please contact me off list at

Message: 5 Date: Sat, 01 Apr 2006 19:32:47 -0000
From: "n8rqu" <n8rqu@...>
Subject: FCC to Deregulate GMRS by 2008

In a bold move the Federal Communications Commission has
decided to deregulate GMRS. This comes at a
time when budget cuts within the Commission are forcing its
Enforcement Bureau to shut down by 1 January 2008.

A spokesperson for the Commission stated that since GMRS
Radio operators are supposed to be self-policing that this new move
"should not pose a problem." And that it would also "solve the whole issue of
restructuring."

This news has come as quite a shock to many in the G.M.R.S.
Radio community, striking up many heated debates. "Basically we're
being told that we're on our own as of 1 January, 2008", said a
highlevel staff member.

In the interim between 2005 and 2008 GMRS operators
are expected to act just as they do now. "Nothing's changed yet, and all the rules and regulations are still in effect," said a
spokesperson for the Commission.

All of this is set to change however, starting in 2008. On 1 January
2008 GMRS in the United States will cease to exist as an
official radio service. At that time it will be up to the operators to make up their own rules and regulations and to enforce them.
To clarify one other issue, "call signs that have not already been
issued will all be available on the 'honor system'," said another
Commission spokesperson. The band-plans and power limitations are
expected to stay the same.

Look for more information on this late-breaking news story as it
becomes available.

I can just see the storm this will start...

People, look at the date!

April 1.....

And it is also posted on other lists as HAM radio,
not GMRS....

this is a scam letter maybe due to apr 1st?

there is one floating around about ham radio also.
don't believe it.

Subject: [radios4sale] 3 Micor C64RCB Repeaters for sale.

Hello,

I have 3 Micor 450-470 Mhz 75 W repeaters for sale.

#1 No Power Supply but has 9.6V reg so it works with any 12V source.
on
462.700 GMRS with Motorola pass/notch duplexer. This is single user with
131.8 Hz decode and 114.8 Hz encode reeds. Working OK at about 40 watt
out
of the duplexer when last checked.

#2 Is a single user complete on 460.375 Mhz. Working OK when last
checked.

#3 is a Community Repeater on 461.575 with one PL 4 user card. WITHOUT
Duplexer but otherwise complete. and doing about 40-50 watts out.

Asking $250 EACH AND YOU MUST PICK UP OR a $40 palletizing charge may
be
assessed over (what I believe are exorbitant) trucking charges.

These are guaranteed to be operational OK before shipment/ or upon
pick-up.

Thanks for looking and I may be reached for questions at Hm: 330-336-3754
or
Cell 330-958-8329.

I am investigating the possibility of using a GMRS portable repeater (truck powered and antenna(s) mounted on a 2" square hitch recvr) for our K9 search unit. What would be involved to get this up and running with one of the units below?

If you can find a Motorola GR300 with the battery
revert option this should work it will work on AC and
12VDC there are many antennas you can use I use a
repeater antenna I purchased on e-bay for $39.just
search repeater antennas they are not always available
but a good 5db gain mag mount will work also.

Hi Walter,

Don't think I am. =c) I stay away from that stuff... Yuck!

Anyhow, I wrote that at 1am, and didn't go into detail. Let me try to dig myself out before I really sound like a nut.

I'll start by saying that I'm an Audio Engineer and I work around musicians every week. The fuses that I have are the "tube, glass" type, not the ones with the prongs. So what does this have to do with musicians? With a Vacuum Tube of a guitar amp, any audio that penetrates through the glass and touches the wire coils inside, will make them vibrate and tend to cause extra unwanted noise. Thus resulting in a hum or buzz, or other audio that we don't want in the final source.

The same idea applies with a "tube" fuse (I forget what they're called, so forgive me on that). It too has a wire inside, and although they may have a thick or thin wire, and are soldered inside the tube pretty well, the audio waves (like what you learned on your ham tests) will travel through the glass and cause unwanted noise on the unprotected wire, causing it to vibrate and produce hums and buzzes. Same concept and idea as a vacuum tube on a guitar amp, but on a much smaller scale. Plus this allows for a more chance of failure in the future, as the connections inside may become loose.

Now if you do use those prong fuses, then forget what ever I said and go on living your life, but for the rest of us still using the tube fuses, take my advice and move them elsewhere where it's less noisy and more stable.

Hopefully now it doesn't "sound" like I'm smoking something. And if you're ever in the area, come on by and I'll give you a tour of my studio and engineering skills.

Sorry Ryan, that is ridiculous. A fuse and a vacuum tube are two entirely different devices. And the "prong" fuses also have a wire suspended inside.

From: kvsp1160@aol.com
Topic: 11180 Message: 11230

The prong fuse does have a wire insde as well, but is protected by plastic, and is not free standing, like the tube fuse. It is not able to move around. It's made of a thick metal, and curved.

I've worked with both types of applications for a long time. I'm not trying to sell you anything. Just from my experience. And I never even said that they were the same. It's the concept of how the noise get's into the line.

I'm an engineer it's what I do. If you don't agree, then that's fine. we'll move on. I thought that I'd be helpful and share my part of what I did and how my setup is in my vehicle. Very simple. Don't see how difficlut this can be.

I have an electrical engineering degree, too, but this is a concept that was never covered in class nor have I ever experienced it. With vacuum tubes (or "valves" for the REALLY old timers), the current passes from cathode to the plate through a vacuum, sometimes through a grid (screen) also. Physical vibration of the elements causes a change in the distance between elements, thereby causing changes in the time it takes for the current to travel from one element to the other (a form of "modulation" if you will). A "glass" or "automotive" type fuse is simply a special wire within a glass tube (also in a vacuum). Since the current passes from one end of the wire to another, how does the "noise" affect the current within the wire ?? The vacuum filled glass is only to control the heat from excess current that causes the fuse to "blow". Any noise that would affect the fuse would also affect ANY wire that was insulated with plastic, PVC, teflon, rubber, etc., unless EVERY wire was a metallic-shielded wire. The only way physical vibration would introduce noise is if there is a loose connection within the fuse itself, a condition that could exist at ANY joint or connection. What have I missed ????

Subject: Re: [GMRS] Re: mobile antenna question

The prong fuse does have a wire insde as well, but is protected by plastic, and is not free standing, like the tube fuse. It is not able to move around. It's made of a thick metal, and curved.

I've worked with both types of applications for a long time. I'm not trying to sell you anything. Just from my experience. And I never even said that they were the same. It's the concept of how the noise get's into the line.

I'm an engineer it's what I do. If you don't agree, then that's fine. we'll move on. I thought that I'd be helpful and share my part of what I did and how my setup is in my vehicle. Very simple. Don't see how difficlut this can be.

The thickness of the wire varies depending on the current rating of the
fuse and the composition of the wire. This is true of ALL wire fuses,
regardless of whether they are plastic, glass, cardboard etc.

> I've worked with both types of applications for a long time. I'm not trying

Yes you are trying to sell something. You are trying to sell your incorrect
knowledge. And I don't beleive a fuse ever resulted in noise in your setup,
unless it was a defective fuse (rare) or your wiring was bad.

Everyone and their dog thinks they are an engineer. It doesn't make your
wrong information any better. Engineering isn't a democracy.. every
hairbrained idea doesn't deserve its day in the sun.

When you spread your (wrong) opinions as fact you are doing a disservice to
people who are trying to learn. Teaching is a responsibility.. make damn
sure you know what you are talking about before you start teaching.

Absolutely nothing.

Originally someone asked me why I put my fuses behind the console vs next to the battery, and I said it sometimes causes unwanted noise. Therfore, I move the fuses to a better location and add ferad cores to the electrical leads from the battery.

Then some guy had to ask why move the fuses, so I had to go into detail of why I did that and why it made noise.

Then they asked why it made the noise and how...

It really was a simple answer, and I was simply stating where I installed my fuses (where every car manufacturer also puts their fuses inside their vehicles anyways!)

My therory doesn't have to be correct. it's just a thought or concept to better help the non-tech-minded person to better understand how I viewed and felt of how I saw the noise affecting my feed lines. Again pretty simple. Not a huge sicence. And I agree with everyone that, although it wasn't the best explanation, it did make a point and show you a basic reason of how one way a fuse could take on noise. Not all fuses or feed lines are made perfect. All products have flaws, and all metals have imperfections. Which is why we have these problems to begin with.

Sorry for the confusion. I'll stick to repeater systems and radio technology for now. Any more questions on vehicle wiring, don't ask.

I fuse both at the battery and at a radio. In 25 years, I've never heard of fuses themselves causing noise unless the fuse cradle has a short or is connected poorly. There are no problems with automotive-type blade fuses vs. glass fuses that I know of. My repeaters both come with blade fuses built right in.

Noise, in my experience, has come from poor grounds, ground loops, and noisy mechanicals such as spark plugs and alternators in vehicles. These problems are easily fixed with some time and patience tracking each component.

11236. HELP! New to GMRS have questions SOS!

Yahoo group: GMRS (2005 — 2007)
Date: 2006-04-04 18:09:56 UTC
From: kdb85711
Topic: 11236 Message: 11236

Hello,

I am new to UHF radios so please excuse my ignorance. I have used CB's quite a bit, but that's the only 2-way radio experience I have. I just bought a pair of Icom IC-F21GM's. I'm reading the manual and I don't understand much. I have a few questions...

1. What is the difference between CTCSS and DTCS? Is one better than the other? Do I use one or the other or both at the same time?

2. What is the difference between Simplex and Duplex?

3. What is the difference between Wide mode and Narrow mode?

Thanks

Hi there! Thanks for stopping in here. We can help you out.

First, you did get the GMRS license for those radios, right? With
that out of the way...

CTCSS and DCS are Continuous Tone Coded Squelching System and
Digital Coding System. CTCSS is a subaudible tone that allows radios
to only open up (recieve) other radios who have the same code when
transmitting. It keeps the radio quiet from other traffic on the
same frequency, so in essence you only hear people in your group or
company, or whatnot. Its not really a "privacy" feature, because
you can hear others and they can hear you if you turn the CTCSS off.
In some terms its called PL, which is the proprietaty name Motorola
gave to CTCSS. Many repeater systems require a CTCSS tone to use,
so users on other systems that may be on the same frequency don't
cause the repeater to transmit. DCS is similar, instead it uses a
digital code.

Simplex is when two radios are transmitting and recieving each other
on the same frequency. Duplex is when the radio transmits on one
frequency, and recieves on another. This is the case when using
repeater systems. Realistically, its half-duplex, because 2-way
radios in GMRS cannot recieve and transmit at exactly the same time.

Narrow and wide mode is the way the frequency is entered in bandwidth. FRS frequencies, such as 462.5625 is a narrow band frequency, whereas 462.550 is a wideband one.

This is the simplistic explanation to get you started. Hope it helps!

Just measure the length of the fuse wire thru the glass (be sure to add a bit if the wire is 'curly').
The calc will probably come out at 1/4wl at a point above 2.4GHZ

Chris,

Thanks for your reply.

> First, you did get the GMRS license for those radios, right? With
> that out of the way...

Yes, I have a GMRS license.

> Narrow and wide mode is the way the frequency is entered in
> bandwidth. FRS frequencies, such as 462.5625 is a narrow band
> frequency, whereas 462.550 is a wideband one.

Still don't quite understand. In what situation would I use one over the other?

So basically CTCSS and DTCS accomplish the same goal, just by different means. So if I set one of my channels to a certain CTCSS code and then set the same channel to use a DTCS code, the radio would cancel the CTCSS code and use the DTCS code, correct? They can't both be used at the same time, right?

More questions:

Am I supposed to identify myself using my call sign every time I transmit or only if someone requests it? Is there some documentation you can point me to, that explains GMRS rules and etiquette?

There is a senior citizen medical taxi service that uses GMRS in my aria. They identify themselves with three digit numbers, are those the last three digits of their GMRS call sign?

There is a repeater in my aria that chirps out some Morse code every few minutes. No one seems to be using the repeater. How do I go about contacting the owner?

Thanks

From: James Jay Craswell
Topic: 11244 Message: 11244

I don't know who cares but I put up a simple groundplane antenna that I made from the ARRL handbook. Its only 15 ft above the roof but gives me clear reception with the little bubble pack GMRS radios from Radio Shaft. I use these to keep track of our kids and wife and I'm happy as a clam!

Hi Robert,

An interesting question. Is this for simplex or for duplex use?

I think the ones I've seen are the obvious codes. For CTCSS, most like to use 141.3, or 250.3, or even 88.5. There are a few others, but I don't recall what they are. As for DCS, I haven't the slighest. I think you'd have a more broad range of picks for digital than analog.

Nor for FRS, everyone always sticks to the first few codes, and never venture into the middle or last few codes. Pick an odd number or odd sequence that seems out of place, like 23, 32, 35, 13, 17, etc. Translation into CTCSS, look em up on the Motorola site or Google.

Narrow band is what FRS uses. Wideband is what GMRS uses. If you use FRS, you'd be using narrowband. If you're using GMRS, you'd be using wideband.

You can't use CTCSS with DCSS, and the other way around. Yes they either cancel out each other or don't work together, in other words. If you're on 462.550 and you want to use CTCSS for your TX, your RX would be 462.550 / CTCSS. If DCSS, then use DCSS for both TX and RX. They both have the same advantage, but one is using a sub-audible tone to open the transceiver, while the other is using a digital tone to open the transceiver.

Always identify yourself when you FIRST transmit on the radio, every 15 minutes therafter, and again at the END of the final transmission. Example:

"This is WPXX123, calling WQXX321."

"WQXX321, go ahead'

(start you conversation) (if your conversation lasts longer than 15 minutes, just repeat you callsign and continue on with your conversation)

To end the conversation. An example:

"Alright Bob, I'll Talk to you later. This is WPXX123, Clear"

"Okay, take care. WQXX321, Clear."

As for the taxi service you're hearing, they either have a grandfathered license that they aquired from when GMRS used to be a business license, or are using it illegally through a radio shop that set them up. If you'd like to, contact them and try to get their license. The thre-digit "license" that you hear means nothing.

Morse code or CWID on a repeater is legal and can be used to announce who uses or owns the repeater. But for those who don't understand morse code, I'd either record the audio next time and ask a ham, then look up the callsign on the FCC website; or responsibly transmit the following on the repeater:

"This is WPXX123, requesting repeater assistance" OR

"This is WPXX123, requesting repeater-owner contact"

It's worked in the past, and is the best legal way to do that. Do not use the repeater without permission, but try the above request a few times every day (for a few days) if you can't decipher the CWID. If both fail, then I suggest to contact your local REACT/RUG organization as they do keep records of past repeater systems.

Hope this helps, 73!

Can you wife communicate with you? Yes she can! Any time. And how? If she's with you and you're both using radio's, try this:

"This is WPXX123. Wife, are you there?"

"Husband, yes. Go ahead."

OR

"This is WPXX123, Mobile 1 calling Mobile 2."

"This is Mobile 2, go ahead."

As long as you FIRST say your callsign before and after every completer conversation, you use your own handles or names. But don't create your own callsigns to replace the FCC-provided license. Very illegal.

Hope that helps as well. 73 (best of luck).

Hi Jay,

I care! =c) What kind of wire did you use for your antenna and what type of coax for your feedline? Also, what radio are you using for your base? Always interested in other's setups!

11249. GMRS Range Problem - feeling a bit decieved

Yahoo group: GMRS (2005 — 2007)
Date: 2006-04-06 00:15:27 UTC
From: kdb85711
Topic: 11249 Message: 11249

Um I just spent $400 on these useless radios and $80 on a usless licence. Documentation says I should have 2-5 mile range. I get poor reception 1/4 mile away. 1/2 mile away, no reception at all. I checked both radios and they are both set to full 5w power. Why have a radio, at that range I could just shout down the block. What's the point!? My handheld CB radio gets better range. Seems like I should have just bought another one of those for $80 and been done with it.

Everyone says GMRS is sooo much better than CB. Why!? Shorter range, less channels, huge difference in equipment cost.

Is there something I'm doing wrong or did I just get taken for a $500 ride.

I thought the Icom radios were supposed to be "Vastly Superior" to the cheap bubble pack radios you get at walmart.

GRRRRRRRRR!

your surroundings can have a lot to do with your range. I haven't
been in to CB in many years but when I was I don't' think a hand held
got much range there either, probably better than you're getting but
that's to be expected. I get a lot better range than that with GMRS
here. It is line of sight though so if there's a lot in the way, you
just won't get the range.

What's the point of the licences and all the rules then? An FCC agent would have to be sitting in my freaking living room to know if I was doing anything wrong.

Great, so it's not something I'm doing wrong. Maybe I can sell them on ebay or something. Poo!

11254. GMRS Range Problem - feeling a bit decieved

Yahoo group: GMRS (2005 — 2007)
Date: 2006-04-06 01:22:57 UTC
From: Lake Hodges Radio
Topic: 11249 Message: 11254

What radios do you have? I have ICOM F21GM handhelds. I get 20-30 miles on simplex and up to 120 miles round trip via repeaters.

Maybe the receiver on one of your radios is bad? Are you using them open tone or do you use a PL?

Maybe I am doing something wrong then. Yes, F21GM's. WOW 20 miles would be great! I really only need 2. I am in an urban aria but i'm in the southwest and there are no buildings over 1 story in the way.

I've tried both open tone and using CTCSS. I don't think it's a defective reciever because I get the same performance on both units. Both would have to be bad.

Any other ideas?

Thanks

You don't give enough info to determine what is going on. Are you trying to talk from a basement? Is there a large or steep hill between you and the other radio. If inside a building, what is the building made of and does it have windows? What kind of antennas are on the radios? The short helicals or or the 6 inch skinny whip? All that has effect on the range.

Yes, sqelch is all the way down.

There is also a monitor button that cuts all sqelch. Tried that too.

John,

They are Icom IC-F21GM handheld radios. As far as I can tell they are set up for simplex operation, set to full power and squelch is all the way down. I've tried both wide and narrow modes.

If you need more specific info let me know.

Thanks

During the most recent test I was inside my home, which is made of brick and the other unit was inside a vehicle. There are no steep hills of any kind between the radios.

6 inch skinny whip antenna.

I'm going to try getting on the roof and see if that does any good.

Thanks

Handheld radios inside vehicles usually do not perform well. You should use a mobile antenna hooked to it or get out of the car and try it. It sounds to me like your application calls for a mobile and a base station, not 2 portables. Going up on the roof will show a big improvement since you are taking the radio out of the house and extending it's line of sight with the higher elevation. Holding the radio sideways instead of trying to keep the antenna veritical can also reduce your range.

kdb85711 <davidabliss@...> wrote:

From: Maire-Radios
Topic: 11249 Message: 11264

I know we sold a lot of the F21 and F24 radio's and have not had many problems with them. I use a F43 and get about 2 to 3 miles around town ground level to ground level inside. Had more range from the 2nd floor to my office from the radio's about 5 miles. .

When we use the repeaters we get more range. This is all in city use and with other problems from electronic noise.

Are you out in the country or city use. what city and state are you in?

thanks John

inside a vehicle will do it a lot too. You'd have to get an antenna
outside that vehicle very likely.

At 10:34 PM 04/05/2006, you wrote:

Just a reminder - GMRS repeaters are not allowed to
broadcast IDs in order to camp out and hold onto a
repeater frequency pair. The ID is to be resultant of
a repeater being used.

I must be doing something wrong then. I did a rooftop to rooftop test
and was barely able to communicate with the other unit about 2.5 miles
away.

Tucson, AZ Fairly flat terrain in the city.

You would refer to her as BOSS, Dear, princes, lover, bride or honey! :)

It does not mater what you call each other. Only that you identify with your call sign (you may both use one license) at the end of a transmission and 15 min intervals during a series of exchanges.

Also, can my wife communicate with me legally, under my licence?

If so, how is she to identify herself?

Thanks

Right. Fully understood. A repeater that is not used should not be parked on a frequency to hold a spot and assume that it's being used. But a repeater that is used, but seems quiet to the unaware user or bypasser who hears the CWID, then it's fine. Or if the repeater has a tone on the in and out, but the CWID is on the carrier Squ., then one may think that it's not being used and camped there. Some controllers have the ability to do that, such as the Zetron Model 38, like I use. But mine isn't set up like that.

Thanks for the clarification. 73,

David and group,

Reading the entire string of this subject so far, it's not necessarily the users error that may be a fault. It may be the antenna that is used, the surroundings, the weather conditions, or something as simple as replacing/charging the batteries.

Even with a bubblepack radio on a rooftop to a vehicle or ground user from across the neighborhood or city block, you hould still be able to TX and hear very well without loss or distortion. So this would tell me that it's either the antenna or a faulty component inside the radio. Or just a few bad batteries - which can happen sometimes.

I'd suggest to buy or borrow two mobile antennas and connect them to the Icom radios, and place the antennas either on the roof or up in a tree (high place), and see how far out you get.

David's right about Arizona. It's really flat and not much is out there to block the signals. Especially in Tuscan. Even if you bought a few amps to connect them to the HT's to boost the signal, it would help. As long as the radio doesn't have the FRS on there, you can transmit up to 50 watts of power. If it does, you're stuck with 1 watt of power, which is what most bubblepacks have anyways.

There are also a few repeater systems out there anyhow, so I'd invest in a few duplex-capable radios and try out a system or two. With a repeater, you can go farther than the 2.5 miles you need and shoot on out to 30+ miles or more, depending upon what that particular system provides.

Topic: 11249 Message: 11271

Also, a bit about CB. A tiny bit so I don't go off topic here...

The only way, either with a handheld or mobile, that CB can TX farther than GMRS, is if you add a linear amp and a power mic to it and modify your rig. Then you have your 5-8 foot mobile whip antennas, and max out your modulation. AM carrier squelch is a longer wave also than FM, so yes, it does tend to go farther, but it also does not work in the forrest, crowded areas, in stormy weather, and high radio traffic. Plus there is no control.

Back to GMRS: Stay with it and don't give up. Once you enjoy the world of FM and UHF, you'll never go back to CB and other junk.

Subject: Re: [GMRS] common PL tones?

Hi Robert,

An interesting question. Is this for simplex or for duplex use?

I think the ones I've seen are the obvious codes. For CTCSS, most like to use 141.3, or 250.3, or even 88.5. There are a few others, but I don't recall what they are. As for DCS, I haven't the slighest. I think you'd have a more broad range of picks for digital than analog.

Nor for FRS, everyone always sticks to the first few codes, and never venture into the middle or last few codes. Pick an odd number or odd sequence that seems out of place, like 23, 32, 35, 13, 17, etc. Translation into CTCSS, look em up on the Motorola site or Google.

Um, it would help if you would post the specific model that you have. Even better would be the FCC model identifier code that is often found on a tag in the battery compartment.

Still, using a handheld in an urban area a range of less than 1/2 mile is about what I would expect. This is about what my Cobra 4000s with a 2.1 watt ERP will do.

Would a handheld CB be any better? I didn't think so.

For more range you need to increase antenna height and transmitted power.

Yeah, licenses for the less than 5 watt handhelds are absurd, especially with all the bubblepack combination FRS/GMRS radios being sold. Mostly it just generates some revenue for the Feds. It is not like you even have to take some simple 10 question online test to demonstrate you know where to find the rules.

>Both would have to be bad.

You can get connectors from an ICOM dealer that allow you to remove the F21GM rubber duck antenna and connect a female BNC connector. Then attach an external antenna mounted on your house roof or car roof. I use a mag mount UHF antenna on my car and a Cushman Ringo Ranger on my house roof. This will give you 3db to 5db gain. You could also get a directional Yagi with as much as 12db gain. Make sure the antennas are TUNED for 462 MHz or 465 MHz (not the 70cm ham band -- 440 MHz). This may solve your problem. The F21GM switches between 1, 2 and 4 watts. Make sure that you're set for 4. You could also try using 12v mobile rigs with 25 or 50 watts power output. Even though they are mobiles, you can use them as a base with a 12v power supply. I use ICOM IC-U400s, but there are many other choices. You can often find U400s used in the $100 range. They do require a special programmer, so you may find a better choice somewhere else.

Also consider using a repeater. That's a longer story for another day...

It's against FCC rules to use a linear on CB or to modify a 27MHz CB rig.

Actually, 27MHz CB with 5 watts and a yagi antenna can travel a great distance when propagation is good and conditions are right. It's not unusual for Hams to work long distances on 28MHz (10 meters) when the band is open. One of my friends used to work Europe regularly on 10 meters with low power (QRP). Right now (2006) this is not common because we are at the low point of the 11-year sunspot cycle and propagation is bad on all bands... especially the upper ones. In 2012, NASA is expecting one of the best (most active) sunspot cycles in 30 years or more. Propagation will START getting better in 2007 or 2008 and peak in 2012.

Thus -- there are times when 27MHz CB will propagate much further than GMRS on UHF 462/467 MHz. Having said that -- there used to be an FCC rule (it may no longer be in effect, I don't know) which forbid 27 MHz CB operators to work more than a certain distance (maybe 150 miles) EVEN WHEN they could hear skip coming in. That was probably the most-often violated rule in FCC history.

UHF frequencies such as GMRS do not propagate (bounce off the ionosphere) in the same way that HF frequencies (which include 27 MHz CB and Ham). On rare occasion we get air-layer ducting and e-layer skip on VHF (144MHz or so) and VERY rarely on UHF. But this is usually limited to 500 or 800 miles on UHF and 2,000 miles on VHF. 27 MHz and other HF frequencies can bounce multiple times and actually go around the world more than once.

Bottom line: UHF and GMRS is mostly line of sight. Even with power and elevation you're mostly limited to 100 - 200 miles. From a very tall mountain (Colorado, Socal, etc.) you might get a little more distance. 27MHz (11 meters) and 28MHz (10 meters) will give you far greater range than UHF when atmospheric conditions are optimal.

If you really are interested in this, get your Ham license. You can work around the world on HF or you can work long distances on UHF and VHF using satellites (yes, there are Ham satellites), the International Space Station, or via linked repeaters and VoIP.

GMRS is not intended for long distance communications. It was originally intended for businesses to communicate short distances in local areas. The FCC is now allowing GMRS to evolve into a family communications system of a couple of miles or so. Unless something

changes dramatically in D.C., that's where GMRS will remain.

You are talking about skip off of the ionosphere. This often seems to
get dragged out as proof of CBs superiority. So what if you can talk to
someone 5,000 miles away via skip when you still might not be able to
talk to someone only 50 miles away. That is great if you are just
trying to contact anyone for fun but not much help when you want to
contact a specific person.

==========

Yes... skip = propagation, same thing.

It's superior only when you WANT to work long distance and WHEN it's legal.

For a long time, FCC rules PROHIBITED CB operators from communicating more than, what was it, 150 miles? Are those rules still in force?

The original 27MHz CB service was an engineering mistake. The FCC authorized operators to work ONLY short distances but gave them a band that propagated long distances. That's live giving a car that goes 200 miles an hour to a teenager and saying "Don't ever drive more than 25 miles an hour." Most CB operators ignored the rules and made things worse by using illegal linears. For a long time, CB was useless because of the interference and skip.

The FCC loves FRS and GMRS because it's virtually impossible to work more than 20 miles (except with a repeater or high power). Even then, UHF will not propagate more than extended line of sight (with a SLIGHT amount of diffraction around trees and hills, etc.).

When you WANT to talk long distances, it's better to get a Tech license and use satellites, the ISS, linked repeaters or VoIP (all legal). Or get a General license and work HF bands that will propagate 12,000 miles when conditions are good.

What is NOT a good idea, IMHO, is trying to use GMRS for things that it wasn't intended, and which are difficult from an engineering standpoint.

Good luck,

-- Kurt

From: Lake Hodges Radio
Topic: 11249 Message: 11283

At 10:19 AM 4/6/2006, David Campen wrote:
>What if you can talk to someone 5,000 miles away via skip when you
>still might not be able to talk to someone only 50 miles away.

==========

You've described the 27MHz CB problem perfectly.

Unwanted skip (sky waves) interfere with local (ground wave) communications on 27 MHz CB. And sometimes 5 watts on 27MHz will not reach as far as 50 miles via ground wave. This is why 27MHz was a bad engineering choice for the purpose that CB was supposed to serve.

You're right that GMRS is superior for local communications between two points that are line-of-sight. But if you put a hill, forest or tall buildings between them, the line-of-sight is blocked.

It's a matter of choosing the right band with the desired propagation characteristics for the desired communications. 27MHz CB and GMRS both have their limitations.

If your communications are for business you may or may not find the right solution. Cell phones may actually be the best choice. If your communications are personal, the Amateur Radio Service might be the best choice, because it offers nine different HF bands and 11 or more different VHF / UHF / Microwave bands. There's a solution for almost every communications need, including voice. data and video.

Trying to use GMRS for anything other than short-range (1-20 miles)personal, family-oriented or small business communications is like pounding a square peg into a round hole.

Good luck,

-- Kurt

The GMRS license fees were originally INTENDED to fund compliance and enforcement, which is a GOOD thing.

However, I think the FCC has used them instead to manage the Janet Jackson incident and similar politically-expedient matters.

FCC Fees and Fines go to the US General Fund. They do not keep any of these fees and fines by statute. Thats why the FCC cannot enforce and deal with everything they should be; they are alloted a specific portion of money out of the US budget to operate. Perhaps if they did keep the fines and fees, they could hire some more agents and enforce rules better and more evenly across the spectrum. Not likely to happen, which sucks.

11286. Re: [GMRS] 27 MHz CB versus GMRS UHF 462/467 MHz

Yahoo group: GMRS (2005 — 2007)

From: John Miller
Topic: 11249 Message: 11286

That rule is still in affect but no one pays attention to rules on CB anymore unfortunately which is why I left that side of things. I used to do a lot QRP on 10 meters when I first got my ham license though and that was fun!! it was amazing how far you can talk when the bands are open and you don't need much power or anything to do it.

So... they are effectively motivating everyone NOT to pay the license
fees, since there is no funding for the enforcers to pursue those
that do not pay the fees.

An endless spiral loop to anarchy...

Wow.

Topic: 11241 Message: 11288

So you're building or are using this with your repeater? Or maybe another repeater? That's the only way to talk on Duplex. If you're building a repeater and have access to DCS tones, then go for it. If not, then CTCSS will work just as good.

If you're using some elses repeater, make sure you ask permission first before foxhunting or fishing for a system on the air and trying to use it. (if you already know this, then don't worry about it. cuz I don't know your plans...) =c)

If I may correct the serious people on this group once again... I was not intentionally saying to go out and buy a linear and modify your CB rig. Again, it was a concept of how it could work. Yes, it's illegal, but most and many don't follow the rules and the FCC doesn't really care much anymore.

Used to have a channel in the bay area that was used for cussing. Turned the guys in back in the days and the FCC gave them a huge fine and visited their homes. These days, they're more worried about orhter important things besides CB. So many modified equipment floating around the internet and fleamarkets that they don't bother with it anymore.

Another concept: The closest way to get more power legally is to use SSB (12 watts) and a good antenna. But not too many people use SSB on CB anymore either.

==========

You're right!

The FCC leadership knows what congress cares about and it isn't CB or GMRS. The FCC is VERY worried about Janet Jackson's chest but NO ONE cares about illegal operation on CB or GMRS.

The Amateur Bands are self-policing. Don't tick off a ham because they WILL get you!

Another issue is this -->> since the advent of cell phones, 27MHz CB is not really needed for emergency communications. The FCC doesn't care how bad it gets because no damage is done to anything important. 462/467 MHz FRS is, of course, also nothing more than a CB band. GMRS has a weird position halfway between an old, dying business band and FRS family radio. If you volunteer to hand over the $80 the FCC will cash your check, but won't pursue you if you don't.

It's only a matter of time until they'll drop the requirement for a license on GMRS for 5 watts and less.

Class D (27 MHz) CB has its advantages and disadvantages.

Disadvantages.. obviously no repeaters, no PL, and not ideal for handheld use due to lack of antenna efficiency.

But if you have a good antenna (mobile or base, not handheld), 27Mhz AM works great for simplex. You can get some really nice range. I used to use them mobile to mobile with my friends "back in the day". We had a wide variety of cheap garage sale radios (this was in the early 80's, post CB craze, lots of cheap radios being sold) and I had access to a nice Bird Thruline wattmeter so I was able to get everyone installed correctly and antenna tuned to "our" channel. In dense suburban or urban areas you get a LOT better range than you get with UHF simplex. I had a big fiberglass whip off the back of my car... It's not just about skip, it's about ground wave propogation and being able to get around obstacles like buildings and other vehicles... If we could have afforded SSB radios for everyone we would have really had it made in the shade...

Of course UHF is a lot better for handhelds, a lot better if you are trying to get through windows...

11296. Re: GMRS Range Problem - feeling a bit decieved

Yahoo group: GMRS (2005 — 2007)
Date: 2006-04-07 01:45:34 UTC
From: Steve Smythe
Topic: 11249 Message: 11296

I know the initial feeling of getting GMRS radios, paying the license fee and realizing that the radios are line of sight. I've been learning about radio and the more I learn (studying for my ARS Tech License), the more I agree with using the right tool for the right job.

Now having said that, I picked up 4 Midland LXT-435'sa while back (based on the LXT-410's) to use for the family when skiing and camping. I noodled around and tested out the range. Some good news and bad news. I live in Southwest Reno up on a hill and have line of sight to the main Reno valley. I've talked over 7 miles away from my house line of sight. I've also talked over 13 miles from the top of Mt. Rose to my house. I was blown away! However, there are parts just 8 blocks from my house in the hills where reception just isn't there. So, line of sight is key.

From what I've been studying and read on this group is that high elevation repeaters are the way to go (or at least high enough to be line of sight everywhere you want to operate). So if your purpose is all personal, you might consider 2 meter VHF HAM and use a local repeater. If business is involved, you're looking at GMRS, LMR, BMR, and other frequencies intended for business.

You spent the money on some great equipment, definitely. You might want to exchange them to make sure the radios are in good condition. If they still don't meet your needs, take 'em back and keep trying.

Are there GMRS repeaters in your area? Are there local radio clubs you can talk with? I'm sure there are HAM clubs that would be happy to help out, if even to just answer questions face to face. That's always nice.

Keep up the effort. It's worth it when it all works. We're here for ya!

11297. Solution to the GMRS Range Problem

Yahoo group: GMRS (2005 — 2007)
Date: 2006-04-07 01:55:31 UTC
From: Lake Hodges Radio
Topic: 11249 Message: 11297

At 06:45 PM 4/6/2006, Steve Smythe wrote:
>I know the initial feeling of getting GMRS radios, paying the license fee
>and realizing that the radios are line of sight...

Guys...

There are ONLY three advantages to GMRS as far as I am aware of...

1) You can run up to 50 watts.

2) You can use repeaters.

3) You can use a gain antenna (some yagi's as are high as 12db or more).

The disadvantage is that GMRS requires an $80 license, even for a hand held.

==========

OTHER than that, if you're looking for personal communications over a
short distance, handheld UHF / GMRS radios and not a great
buy. Range is very limited with simplex hand helds on UHF.

A BETTER solution for HANDHELD radios are MURS radios. (Multi-Use
Radio Service).

These are VHF (151 MHz range) radios. VHF propagates BETTER than
UHF. It diffracts around hills and trees and buildings BETTER than UHF.

If you're a ham, you know that VHF (2 meters) propagates better then
UHF (440Mhz / 70cm). VHF can sometimes travel TWICE as far as UHF.

MURS radios on VHF DO NOT require a license.

On MURS you can also send data and collect data from temperature
devices, remote sensors, etc.

If you are using ONLY hand held radios, MURS may be a better option than GMRS.

Limitations of MURS...

1) 2 watts max output.

2) No repeaters allowed.

However, you CAN use high-gain antennas.

TWO WATTS on VHF with a gain antenna will travel farther than 4 watts on UHF.

==========

Good luck!

I have absolutely no problems being able to contact my local FCC district office and getting problems solved - in amateur, GMRS, and commercial matters. It has been my first-hand experience that "Funding" is not a problem at all: the urgency and legitimacy of the problem - as well as the manner in which it is presented - are all that matters.

I agree with Clint. Regardless where the money goes, every service
needs some ground troops. Perhaps if we spent a little less time on
these boards and a little more time contacting the FCC with issues,
things might be different.

I don't find it much of a disadvantage. For 6 dollars from each of my family members who use it, over the course of five years, its quite an easy and cheap investment. Not to mention getting the license can breed responsible users and make a good investment into GMRS.

Perhaps if we did things right in the beginning, we wouldn't be at this point now. When the Tandy went after the FCC for FRS, how many complaints or petitions to the contrary were there? How many interference complaints came in after the fact? Since the advent of the GMRS/FRS bubble pack, how many of you lodged a complaint? Have you ever lodged a complaint? I know the PRSG did some heavy leg work, as did some other folks, but they obviously couldn't do it alone, which they did anyway because they believed in something.

Part of the problem is the FCC shows little GMRS complaints, because many people had resorted to dealing with it. Some folks now are starting a process (PRA, perhaps you heard?) and surprisingly, things are getting done. I'm not trying to say that the bubble pack debacle is all of our fault. The FCC sure was greasy in their own way too. How many of those complaints were hidden?

However, if we intend to keep this service alive, we need to license, and get as many others as possible licensed, and use the spectrum for what it is intended. I highly doubt that even the little 8 frequency pairs and their associated interstitials in this portion of the UHF spectrum will go completely license free. How easy to auction this off or put it into the biz band where license fees are several hundred dollars. If twenty dollar bubble packs are a problem now, they won't be then if the FCC were to reband it. Who's got something to lose? The bubble packers? Nope..the manufacturers.....and to the FCC: big deal. Money talks folks. Lets keep on licensing and sharing with one another and use it the way it is intended!

Of course, this is speculation and opinion. Nonetheless, sounds pretty good!

Chris

The R/S proposal was perfectly OK. It setup the interstitial channels, with narrow modulation, limited power and non-modifiable antennas.

What has corrupted the the 'waters' was the FCC's (unbelievable) decision to type certify 'combination' GMRS/FRS units (15 and 22 channel units).
That's where all the problems truly stem from.
14 channel FRS units? Perfectly OK.
Combination units? Nightmare.

11305. Future of FRS/GMRS

>Walter, WPXP269

Somewhere around 10 or 15 million of those little radios are sold each year.

I really do believe that the message is this -->> The FCC envisions
that GMRS and FRS will eventually become one. Everyone will be
running around with bubble pack radios operating with 5 watts or
less. The repeaters and mobile rigs and base stations will
eventually wear out, and the higher performance users will migrate
over time to other services and other frequencies.

Five years, ten years? Not sure.

But one day, everything that we now know as FRS and GMRS will be the
same, a short range system for families and friends.

Check back here on April 7, 2016 and we'll see if I am right.

Good luck!

The R/S proposal had holes in it when it came to putting frequencies between repeater inputs. Seldom does a time go by that I am not at one of my repeater sites and don't hear someone in the RX on a FRS radio that has gone off frequency.
The site that is eat up with the worst of it is the one on the high ridge closest the town.

ka1jfy <walter.howard@...> wrote:
The R/S proposal was perfectly OK. It setup the interstitial channels,
with narrow modulation, limited power and non-modifiable antennas.

What has corrupted the the 'waters' was the FCC's (unbelievable)
decision to type certify 'combination' GMRS/FRS units (15 and 22
channel units).
That's where all the problems truly stem from.
14 channel FRS units? Perfectly OK.
Combination units? Nightmare.

Right. But Cobra and others now make SSB a part of their mobile rigs and are more affordable these days. Just like in my Cobra 148GTL, it has both AM and SSB, and I bought it for under $120.

Good deals and they'll save you when you need them in areas that don't have GMRS service or repeaters. Plus, most truckers and other drivers these days (at least here in CA) are more than willing to talk on their rig to pass time as well from state to state. And if you need help, they're there to assist you as well, from directions to calling in emergencies.

I really don't see this happening. There are more repeaters on the air now than ever and licensing has been increasing also across the US. Repeater cooperatives are popping up all over the place, with more in the works. These cooperatives allow an unprecedented amount of shared resources that keeps the service in check and actually uses it. I can't say ours is the first, but it is most certainly the biggest, most organized, and most copied. We thank our membership and other repeater groups for those honors.

Even if there are "only" 76,000 licensees, it most certainly doesn't mean there are only 76,000 users. My family alone has 15 people under my license. So, if one does the math, there are literally millions of licensed users, and many millions of dollars in repeater and local system investments.

I really can't imagine migrating anywhere else. GMRS is the perfect communications medium for a family who knows of it. We have a group here at home active in educating the bubble packing environment. Got some of them licensed, and the remainder stay to the FRS voluntarily. We do get some scourge, travellers and visitors who quickly learn. Education works, at least here. Moral of the story: educate and share and work to protect the spectrum. I, for one, will not take a defeatist attitude.

Chris... EXCELLENT ANSWER!

Thanks... glad to hear that you are doing so well in your area, but you are very different from us.

We have GMRS repeaters here in CA, too, but the majority of them are closed and not accessible to the general public. Travelers and casual users are discouraged from using most repeaters. Those that are open are rarely used.

Cell phones are cheap and plentiful and work 99% of the time. Kids start getting their first cell phones around 11 to 13 years of age. Some HUGE percentage of 18-year olds have cell phones. GMRS radios are a novelty for a few days, but eventually everyone wants a cell phone instead. Most women hate radios and by FAR prefer cell phones. Only geeky guys (like me) use radios.

The $80 GMRS license discourages most people from moving beyond the bubble packs with their 2-8 mile range. They're great for picnics and backyard use, but that's about as far as most people go. There is not much education happening and most members of the general public have no concept of what a repeater is. Most radios are not repeater capable. No one understands why they should pay $120 or more for a repeater-capable radio and an $80 license when they can get a free cell phone and a $30 - $50 per month nationwide calling plan.

Check back here in April, 2016 and let's see what happens between now and then...

While I agree that GMRS will be here for a long time I do find it a bit disturbing that a group of people would even consider joining a repeater cooperative! While GMRS rules require cooperation between repeater owners there is no one group that has any control over individual repeaters or families that use any GMRS frequency. I find it a problem when some one organization tries to dictate or become some type of officious agency ! While we have hundreds of repeaters (perhaps thousands) on GMRS I have found that there are a number of groups that think they own the frequency when in fact they do not! I hear repeater operators that have their repeater on beacon mode(Id's every so often) which is against the rules of GMRS. Other organizations get mad when you operate on 'their" frequency! These bands are for public licensed use and if someone wants control of repeaters get your ham license and join the local repeater coordination ARRL group and have at it. While we all have to get a long with each other we do not have to be forced into any type of 'coordination group'! There are many repeaters here in Florida and while my repeater (as well as the mobile repeater) is on a specific GMRS split I have no problem with others setting up a repeater on the same frequency! And people do! We pay the FCC wages and their job is to police the bands and when I do see a problem of illegal operation I do report the violation as we all should. They are the official agency!
Just an observation .

You are correct.

I have seen a few folks and organizations who have laid claim to a specific frequency (such as .675) and tried to defend it against other users. When those other user are unlicensed, they have a valid complaint.

However, when a duly licensed GMRS user selects a frequency and an unused tone, the FCC's position is "The rules say the frequency must be shared."

Some groups have set up cooperative committees to try and "coordinate" GMRS repeaters. When everyone voluntarily cooperates, this is great and is a benefit to all.

I have to agree. I got my license last spring when our search unit started using GMRS for our training. I got a Kenwood mobile for my jeep and I have to say, I don't hear millions of bubble packs as I drive around. I live in CT and as I come up 91 into Hartford I will get an occasional transmission but for the most part it is pretty quiet. We stopped using the squelch codes because we wanted to know who else was on the channel and there is very little traffic where we go.
I think most kids today don't want to bother with somthing as unreliable as radio when they have cell phones.

==========

Joe... I AGREE with you, thanks.

However, I don't think you don't mean that radio is unreliable. When the user knows what s/he is doing, it is MORE reliable when you're contacting someone with a radio who knows that THEY are doing and their radio is turned on and when they're within range. In disasters and homeland defense incidents radio is more reliable between trained radio users.

What you mean is that radio is more difficult to use and harder to understand. And cell phones can reach more people in a wider area more easily. But when the power goes off and a disaster hits, cell phones are more dependent on the infrastructure and thus are less reliable. Point-to-point simplex radios will always be more "reliable" and that's why GMRS users and Hams love them.

Am I right?

Uhh... I'd have to disagree with you Kurt. Maybe it's different to Chris in Souther California, but not up here on the Northern Half. We have several opern repeater systems with membership oppertunities. All you have to do is ask. No fees or extra time in trade for the system. And we have absolutely no problems with bubblepack users on our repeaters, we maintain our systems with high equipment and high respect, and rarely do we receive complaints or problems from any of our end users.

For those who are in need of a system to use or want to start their own system, they usually contact myself (Bay Area Repeater Net) or talk to our local RUG/REACT group which in return guides them with their choice of frequencies or contacts.

That's what I sometimes don't get with So Cal users. Both parts of California have the same amount of congestion, but yet we operate things differently.

I'd say join the state and work together. I'm all for it. And I've already started to do that with our local groups and private orgs for GMRS repeater systems. They love the idea and are willing to work with us.

As Chris stated in a previous posting, all we need to do is take action and stop talking about it. If we focus on our goals and complete them, I know that we will have a better organized service almost or just as good as the ARRL. It's what I had to do when I started the Bay Area Repeater Net, and I've come far. Now I'm building repeater systems to serve our coummunity.

If the ARRL started in a small office and now has become a huge success, why can't we do the same thing? What's stopping us? What are we afraid of? Should we branch off of the PRA, or the PRSG, or start our own? So many members on this group and not one of us has a few minutes to make a few calls and say "Hey, I'm starting a new org. Join me." I'd love to, but it's hard enough owning two businesses and an organization. But will be happy to chip in to help in any way that I can. Just let me know and I'm there, radio in hand, mind on the subject...

Ok, maybe not unreliable but surely a tool with a different mission. Good for talking down the neighborhood or across the mall (but way too uncool for a teenager). Good to send someone out in the woods to tell us when the dog makes a find but if there are any hills take the Icom which has better range. Kids might play with them but would only hold the interest for a few hours. Blessedly the range on the bubblepacks is very short here in the northeast and the band is usable and convenient for short range communications for everybody. As with the waining interest in ham radio, I don't see trivial use of GMRS increasing.

Steve,

I will address this because I feel compelled to. I can only speak for myself and my group.

> While I agree that GMRS will be here for a long time I do find it
>a bit disturbing that a group of people would even consider joining
>a repeater cooperative! While GMRS rules require cooperation
>between repeater owners there is no one group that has any control
>over individual repeaters or families that use any GMRS frequency.

First off, really, what is wrong with any group? What realistically is wrong with a sharing agreement? What is wrong with sharing finances and resources? No repeater in our entire group claims any share to any frequency, no repeater broadcasts ID's or anything of the matter. As a matter of fact, some of our systems (mine included) share the frequency with other repeater systems with no trouble. Not to mention, what a good way to voluntarily coordinate systems!

>I find it a problem when some one organization tries to dictate or
>become some type of officious agency !

Whats the problem with again, sharing resources, information and helping others?

>While we have hundreds of repeaters (perhaps thousands) on GMRS I
>have found that there are a number of groups that think they own
>the frequency when in fact they do not! I hear repeater operators
>that have their repeater on beacon mode(Id's every so often) which
>is against the rules of GMRS.

Have you made contact with these groups about these activities? Made any reports?

>Other organizations get mad when you operate on 'their" frequency!
>These bands are for public licensed use and if someone wants
>control of repeaters get your ham license and join the local
>repeater coordination ARRL group and have at it.

I agree this could be a problem, and again, have you dealt with it? Also, ham radio freqs are free to use, coordinated or not also....

>While we all have to get a long with each other we do not have to
>be forced into any type of 'coordination group'!

This is your choice, but nobody is forced into out group and everyone in it, loves it. Please don't disregard the groups who are

responsible.

>There are many repeaters here in Florida and while my repeater (as
>well as the mobile repeater) is on a specific GMRS split I have no

Chris, usually when a group says we are sharing resources usually means if you donate money we can offer you a use of our repeater. I prefer as others do to say if you want to use the repeater feel free to do so! It is a disguised way of charging for the use of a repeater which is against the rules. You make comments like our group is making it a more responsible place' but what do all the other operators do? The same more then likely but for free. Yes there is a place for groups and it is called a 'club'. A club is formed to offer people of the same interests a chance to gather as a group and to offer ideas and suggestions to each other . There are of course many clubs such as REACT,SAR, and many more but they are clubs not professing to be a coordination group. Yes I do report violations as should everyone. But I report them to the FCC who in this area seem to be able to correct the problems pretty quickly. Oh and by the way ham repeater frequencies are coordinated and if you just up and came on a frequency pair you would here about so fast that your head would spin. Why do so many Hams set up a GMRS repeater? I have said what I wanted to say and if you are comfortable with your way that is fine but I do not believe in groups spouting that they offer something that should be free anyway. Wish you continued success with your group but I do disagree with the idea that we can and should charge for equipment repairs etc. If you want a repeater then be willing to pay for it yourself as your license is on it. Understand Chris I am not knocking your group or any other group for that matter it just gets my dander up when someone says they are a coordinator for GMRS when that is a make believe title.
Thanks

Subject: [GMRS] Re: Future of FRS/GMRS

Steve,

I will address this because I feel compelled to. I can only speak
for myself and my group.

> While I agree that GMRS will be here for a long time I do find it
>a bit disturbing that a group of people would even consider joining
>a repeater cooperative! While GMRS rules require cooperation
>between repeater owners there is no one group that has any control
>over individual repeaters or families that use any GMRS frequency.

First off, really, what is wrong with any group? What realistically
is wrong with a sharing agreement? What is wrong with sharing
finances and resources? No repeater in our entire group claims any
share to any frequency, no repeater broadcasts ID's or anything of
the matter. As a matter of fact, some of our systems (mine

included) share the frequency with other repeater systems with no trouble. Not to mention, what a good way to voluntarily coordinate systems!

>I find it a problem when some one organization tries to dictate or
>become some type of officious agency !

Whats the problem with again, sharing resources, information and helping others?

>While we have hundreds of repeaters (perhaps thousands) on GMRS I
>have found that there are a number of groups that think they own
>the frequency when in fact they do not! I hear repeater operators
>that have their repeater on beacon mode(Id's every so often) which
>is against the rules of GMRS.

Have you made contact with these groups about these activities? Made any reports?

>Other organizations get mad when you operate on 'their" frequency!
>These bands are for public licensed use and if someone wants
>control of repeaters get your ham license and join the local
>repeater coordination ARRL group and have at it.

I agree this could be a problem, and again, have you dealt with it? Also, ham radio freqs are free to use, coordinated or not also....

>While we all have to get a long with each other we do not have to
>be forced into any type of 'coordination group'!

This is your choice, but nobody is forced into out group and everyone in it, loves it. Please don't disregard the groups who are responsible.

>There are many repeaters here in Florida and while my repeater (as
>well as the mobile repeater) is on a specific GMRS split I have no
>problem with others setting up a repeater on the same frequency!
>And people do! We pay the FCC wages and their job is to police the
>bands and when I do see a problem of illegal operation I do report
the violation as we all should. They are the official agency!
> Just an observation .
> Steve WQDW656 / N4YZA

Fair enough, but not all of us are frequency camping and screwing around on GMRS. Some are trying to make it a better and more responsible place.

--- In GMRS@yahoogroups.com, "Stephen Rice" <srice3@...> wrote:
>
> Chris, usually when a group says we are sharing resources usually means if you donate money we can offer you a use of our repeater. I prefer as others do to say if you want to use the repeater feel free to do so! It is a disguised way of charging for the use of a repeater which is against the rules. You make comments like our group is making it a more responsible place' but what do all the other operators do? The same more then likely but for free. Yes there is a place for groups and it is called a 'club'. A club is formed to offer people of the same interests a chance to gather as a group and to offer ideas and suggestions to each other . There are of course many clubs such as REACT,SAR, and many more but they are clubs not professing to be a coordination group. Yes I do report violations as should everyone. But I report them to the FCC who in this area seem to be able to correct the problems pretty quickly. Oh and by the way ham repeater frequencies are coordinated and if you just up and came on a frequency pair you would here about so fast that your head would spin. Why do so many Hams set up a GMRS repeater? I have said what I wanted to say and if you are comfortable with your way that is fine but I do not believe in groups spouting that they offer something that should be free anyway. Wish you continued success with your group but I do disagree with the idea that we can and should charge for equipment repairs etc. If you want a repeater then be willing to pay for it yourself as your license is on it. Understand Chris I am not knocking your group or any other group for that matter it just gets my dander up when someone says they are a coordinator for GMRS when that is a make believe title.
> Thanks
> Stephen Rice
> N4YZA/WDQW656

Stephen,

Again, I will answer you directly. I appreciate your concerns and opinions, and I will again offer mine. First, when it comes to finances, I have never charged a dime for anyone to use my very expensive repeater at a commercial site. Anyone who wishes to donate does, but it at no obligation. The entire LAG Group functions that way. Not a dime. We charge not a dime for anyone to join us. Never have, never will. The question about responsibility of the "other operators" is the same. It is part of being in our group.

The question about GMRS coordination. Perhaps there is some confusion. We are not a coordination group for the general world. My "coordinator" title is that of someone who oversees the direction of our group internally. We are not, and I certainly am not, a repeater coordinator for the general GMRS. I am the coordinator for the LAG Group.

As far as ham radio repeaters go, frequency coordination is NOT necessary to set up a repeater. You are just not afforded interference protection from a coordinated one, and likewise are responsible for any interference made to a coordinated one. Check out Part 97.

I hope this clears some misconception up for you!

Chris

Thanks Chris for your response and I agree to disagree with you and will move on. This issue while interesting is meaningless in the general scheme of things. GMRS, I beleive will be around long after I and maybe you are gone and even if the manufacturers sell thousands more of the FRS radios people get tired real quick of not being able to talk very far and go buy a cell phone. But I do thank you for offering your opinions.

From: Ben
Topic: 11249 Message: 11322

Yea, SSB is now a no-brainer. But now SSB radios cost less and $120 doesn't seem like a huge sum to me. Back when I used CB on a regular basis with my friends, $120 was a lot of money to us. We got our radios either at yard sales ($10-$25) or for free from people who had lost interest in them. Antennas, sometimes we would buy new, get used magmounts or used whip antennas which I would fix up (add new cable etc).

If I had to do it all again today I would convince everyone to get SSB radios. But we did quite well on AM.

I agree with whoever said the big mistake the FCC made was to type accept dual FRS/GMRS radios. The second big mistake they made, maybe a bigger mistake, was restricting the license group to families. All they accomplished by that was to create a nation of lawbreakers. Personally I do not have much need to use radios with my extended family, I have a large need to use radios with friends, most of whom are unwilling to pay $80 to use the radios a few days a year. I have a couple of MURS radios...

11325. [GMRS] Cellphones vs GMRS (was CB vs GMRS)

Yahoo group: GMRS (2005 — 2007)
Date: 2006-04-08 18:26:44 UTC
From: kvsp1160@aol.com
Topic: 11325 Message: 11325

So let's offer this up. Would your friends (noted from CB posting) switch over from a cellphone monthly cost of around $29 ($348/year) to use a repeater system that would cover the entire city that they lived in, plus coverage for areas that cellphones would drop out in? And when the power goes out, some cell sites don't have backup power, wheras repeater sites do - either by a generator, solar, wind, or water (if available).

But this doesn't mean that they have to give up their cellphones. In simple terms, look at it this way:

GMRS license for 5 years: $80

Cellphone cost (at $29/mo) for 5 years: $1,740

Major difference. And most repeater systems are either somewhat used or just sitting there waiting to be used.

Think about it... Just my 2 cents today.

..hear someone in the RX on a FRS radio that has gone off frequency...

Total nonsense. If you are hearing FRS traffic on your GMRS repeater, then your repeater needs to be properly aligned. You should take your system off the air until you can get your act together. FRS units have tighter specs than some older UHF equipment...

I live in the most populous region of the country for GMRS/FRS users, and there is not one legitimate, documented case of an FRS unit being 'off frequency' and interfering with GMRS operations.

You are still talking about apples and oranges. You can't talk to someone on your gmrs if they don't have one. And if everybody had one and tried to use it not many would get thru. I can't imagine my wife at work in the insurance company with her little gmrs radio on her desk.

Well I hate to tell you that yes FRS radios do go off frequency as well as repeaters,mobiles,portables and every other type of radio device! Yes of course check the repeater receiver(it would be the receiver if it was off frequency and hearing a FRS radio) and transmitter! Also check using a receiver higher and lower in frequency. When in doubt check you equipment first then if there are still problems you know it is from something else and just means you have to track it down. Good luck with it and don't let anyone say that radios don't go off frequency! Some of the China knockoffs are the worst for it and usually when the batteries start to get low.

Before you go all ballistic with this, there is a reason this could be happening and it is not a fault of a bad repeater.

If the GMRS repeater is a Micor repeater the receivers have an AFC on the RX. It is there to keep the rx centered on the mobile station. When splinter channels stated to be used there was a teck bulletin to disable the AFC. this is done by a small jumper on the rx. Many times this gets pulled of by shops as it is not listed on the diagrams.

the FRS 467 channel are close and will pull the AFC over. I do not know if other repeaters had this I only know of the Micor. Other than this then yes a receiver that is not centered on channel would be the only other cause.

I don't think you're grasping the point I'm making. I didn't say to trash your cellphones and carry around radios for the heck of all I care! I said that if you compared the cost of GMRS vs cellphones and the actual use that they each provide, GMRS is much more cost efficient than cellphone's are. And that if the power or other emergency were to happen that would cause cell towers to shut down, you'd have GMRS or even ARS radios to rely on.

But you missed the entire point I was making and clipped/edited my posting to make it sound like I didn't know what I was talking about.

Maybe you should do a check on yourself for a change. It's not myself who's at fault here.

Just take a deep breath, look at both sides and see what I was originally saying. You don't have to agree with it, but understand at least what I was saying. That's all I ask.

Glass mount is okay, but gives you no ground plane connections. I'd go with a mag mount or a trunk mount. Glass mounts leave a sticky residue and some models are hard to get off once you apply them. Plus the fact that you just lost physical contact between your coax line and the antenna.

I'd stay away from glass mounts, even if it looks cool and matches with the other cars out there. May work for cell phones, but not for radios. I used one, and it failed.

My two cents... If you want some models for mag or trunk mount antennas, then let me know. eBay has some great high-end models for low-end prices. Bought a few on there, and have no complaints.

11338. Re: common PL tones?

Yahoo group: GMRS (2005 — 2007)
Date: 2006-04-09 14:25:18 UTC
From: rtoplus
Topic: 11241 Message: 11338

An interesting tidbit of info regarding PL tones. Tones in the higher range take longer to decode than ones in the lower ranges (I think I have it right). None the less, one range takes longer than the other. This can be an issue with chopped off beginning words, etc.

I agree that 141.3 is probably the most commonly used tone...bubble pack users excepted.

Properly installed Radiall Larsen KG Series through-glass antennas perform excellently.

...use a mag mount...

Guaranteed to scratch the car.

Hi Clint,

I have two mags on my truck and although it leaves weather rings (light oxide rings that can be cleaned off with soap and water) on the roof of the vehicle, I never have had any scratches on the roof from the magnets. And they've been on the roof for over a few years. Rarely taken off to, and when done so, only to clean the rings or to replace the antenna.

The only way it would scratch your vehicle, is if you forget that you have mag mount antennas on your vehicle and drive into a parking garage, and WHAM! they pop or scrape off in the process of being hit on the roof.

Besides that, no problems. Sorry if you've had troubles with them in the past. Great little units if you can't use NMO mounts or have a trunk (SUV/truck).

Just an idea. When I've used mags, I get an old floppy disk sleeve (5
1/4 inch) if you still have them, that tough plastic material, but
flexible (remember those?) and cut it the same size as the magnet. Place
it under and you don't have to worry about scratches.

I suppose any other suitable plastic will work.

Sean

hey, that was an honest question. I've used PL on the
simplex side of a (amateur) crossband repeater to
control access to the link radio. I've also used it to
only activate the receiver speaker on simplex links
for traffic I was interested in.

Atta Boy! LOL.

Bought the wife a new mini-van...told her the antennas came with the purchase of the van. I'm lucky though, she digs the GMRS system.

I'm concidering purchasing a GMRS repeater.

Besides the somewhat punitive cost of the unit itself, what other expenses should I plan for i.e. antenna, antenna tower/pole/wadeveryacallit, coax, etc.?

I'm assuming that a "repeater" can be used as a repeater and a "base station" at the same time, correct?

I know very little about RF, so please excuse my ignorance.

David,

If you buy a complete system, brand new, from eBay or a communications company, it may cost you in upwards to $1,000 or more. Then you'll need to add your coax, tower, and antenna. Which may cost an additional $500-$1200+.

However, if you build one (or have someone help you build one) from parts, the cost is much less and you will have money left over for other needs.

To build your own repeater, you'll need the following:

- a base radio (either a radio that can transmit and receive seperately, or two seperate radios for RX/TX) $25-$80+
- crystals (if radios are not programmable) $45+ per pair
- a duplexer (4-cell, 6-cell, or 8-cell) (always even cells) $50+
- a controller (includes a tone panel, repeater controller, CWID, other repeater extras) $85+
- coax jumpers (from radio to duplexer) $15+
- coax feedline $100+ (NOTE: if coax is high quality and length is greater, then price will be higher)
- antenna tower (if needed - 20 feet or greater) $100+
- antenna (omnidirectional; gain optional, but good to have) $100+

The total price for this system is $475 to $530+. My system (building it ourselves) cost our group only $455 (minus the cost of the coax, was free as a trade in services - which would have cost us around $800)

A few extras that I mentioned would be: lightning protectors, wiring, power strips & surge protectors, rack hardware (to rack repeater equipment), and adapters.

All from eBay. Very easy, cost effective, and either used buy-it-now items, or watched for my items that I needed and paid with PayPal. All shipped to my door.

11352. Re: FCC to Deregulate GMRS by 2008

Yahoo group: GMRS (2005 — 2007)
Date: 2006-04-12 10:34:22 UTC
From: markj99999
Topic: 11213 Message: 11352

I'm actually sort of sorry this is a hoax, because when I read it, I felt a sense of relief: I could finally give up my one-man campaign to educate advertisers to say SOMEWHERE in the ad that a "GMRS license is required" on all those "FRS/GMRS" radios that sell in the department stores, and even toy stores.

Yes, they are toys, but yes too, they can produce nearly 5 watts ERP. I know because I bought several of them, and have measured their output.

I used to write a letter to the advertiser whenever I saw an ad for "FRS/GMRS" radios when there was no mention of the license requirement, and was blown off nearly every time. I've written to the FCC and been blown off with "The manual that comes with the radio, or the label placed on it by the manufacturer, should indicate the service the unit is certified for. If you cannot determine what service the unit may be used in, contact the manufacturer."

But I give up. It's hopeless.

Oh, but wait! Right now there are whole bunch of 10 year old kids who have been handed 5 watt FRS/GMRS radios for their birthdays but are waiting until they "contact the manufacturer" before they sing the "Happy Goose Song" into their radios.

Hee hee. April fools.

and now you have a repeater that is not type approved by the FCC. Just because a radio is part 95 as a radio it is not as a repeater. This only works in the ham bands.

You are receiving this email in response to your inquiry to the FCC.

There are no known measures being taken at this time to deregulate GMRS Radios or to shut down the FCC's enforcement activities. Any initiatives in these areas would be posted on the FCC's main website as a Public Notice or a News Release.

Does every single component of the repeater need to be type approved
by the FCC or just the transmitter?

What about the antenna? Does it need to be GMRS "type approved"?

Thanks

it is the transmitter on that has to be part 95 and listed for repeater use.

11360. Re: [GMRS] Re: Considering buying a GMRS repeater

Yahoo group: GMRS (2005 — 2007)
Date: 2006-04-12 22:43:20 UTC
From: Ronny Julian
Topic: 11348 Message: 11360

Can someone provide a real and complete list of what is and is not approved instead of this speculation? I know amateur UHF stuff is out even though I see plenty being used on these frequencies. Every other service has a type acceptance listing I'm sure this one does.

Does not really matter in the long run as long as your equipment checks out to be within specifications and does not interfere with anyone else.

11361. Seriously considering buying a GMRS repeater?

Yahoo group: GMRS (2005 — 2007)
Date: 2006-04-12 23:35:02 UTC
From: Lake Hodges Radio
Topic: 11348 Message: 11361

If someone is SERIOUS about buying a good quality GMRS repeater (not a cheap, low performance one), send an email to -->> N6MD@...

I think I know where a good one is available, along with some matching HTs.

-- Kurt, N6MD

From: kvsp1160@aol.com
Topic: 11348 Message: 11363

Yes and no. I agree that using equipment that is Part 95 accepted is good, equipment that also follows the guidelines of part 95 is also fine. It's your decision.

My equipment is using both statements. The tranceiver is both part 95 and 90 compliant, as well as it follows the strict guidelines of the Part 95A rules and regs of GMRS.

But nowhere does it mention in part 95 about repeater rules and regs. Just radio basics and your transmitter. So we assume the same applies to both, and use common judgement.

From: Stephen Rice
Topic: 11348 Message: 11364

I am curious. Can you please point me to the clause in part 95 where it says a transmitter has to be listed for repeater use? I seem to be missing it in part 95. Most equipment that is part 95 can be and is used as both portable repeaters as well as stationary repeaters.
You could for example use a good
Micor Base/Repeater w/duplexer 200.00
a good Controller for 97.00
a set of xtals 100.00
antenna 60.00
coax 400 .85 a foot and up depending on type

some labor and you have a repeater ! Some would say its old but those that know will say they take a licking and keep on ticking! Others will say they could not find a UHF Micor with a duplexer for 200. I did.
You could also take
2 M/a-com Panther 300M's 100.00 total
1 mobile duplexer 45.00 to 150.00
1 controller 95.00
1 antenna 60.00
coax 400 .85 a foot
telescoping mast 40.00 appx. (not sure on this exactly)
POWERED from Vehicle 12 Volt

and you have a mobile repeater for a emergency services capable of 30 watts (reduced power mode)
Also find the same type of arrangement for Motorola 300's or 1225's !

Just remember you still have to locate a site to put the repeater at. Some put theirs at home and some pay for a commercial site and even others get a free commercial site for helping a non-profit organization.
You can spend a lot of money or you can shop like others have said and assemble something.
Just remember that you are responsible for the correct operation.
Some that know me know I will help people around me whenever they ask for help and if you check in your area you may find a tech person that will help you. Good Luck

From: kvsp1160@aol.com
Topic: 11348 Message: 11365

I bought a GE Mastr Executive II for my repeater system, which cost under $65, and I had volunteer helpers to do the tuning. The installation and building was done on my own time and on my own. Very easy to do via online instructions.

The GE Mastr II line of radios are part 90, 95, and other parts accepted. I actually did the research before I bought some cheap gear online. And since the Executive II's go for a small cost, I bought a second one for backup. If the main unit goes bad, just swap out the ICOMS (crystal modules) to the backup unit while I repair the main unit. And the repeater is not off the air for more than a few minutes during the switching process. Just plug-in-play.

Back to whether your radio should be FCC type 95 accepted or not: The bottom line is this. If the radio was build to Part 95 specs, and approved by the FCC for part 95 operation, then there's no questions asked. If you bought a radio that is not approved by the FCC for part 95 operation, but you modified the parts and internal operations to specifially meet and exceed the requirements that the FCC would approve of, then I would assume that it would be okay to use it.

To be safe, and only if you really want to, write to the FCC office or call them and arrange a scheduled appointment for an agent to take a tour of your repeater facilities to see if your equipment meets and/or exceeds part 95, and if the FCC approves it's operation. (or don't tell anyone and let the guilt hang on your conscience). But I prefer to try finding radios that are already approved for Part 95 or meeting with an FCC agent at your repeater facilities to approve such operations.

While I agree with the 1st statement for the most part, there are exceptions where one could void the certification for usage...adding a different antenna to an FRS radio for example or changing out parts on a GMRS radio that no longer keep it within spec.

The second statement however is totally untrue. If a radio is not part 95 certificated, adding or changing all the parts in the world will NOT make that radio part 95 certificated to use in GMRS. You could, however, have the radio spec'd out by a certification lab, send the results to the FCC along with the $$$$$$$$ required for filing fees and get your certification that way.

Having said that, I have no problem with folks using radios that have part 90 specs that meet or exceed their part 95 equivilant. One just can't simply change out components and automatically achieve part 95 certification.

Let me correct my previous post and replace the above paragraph with
this one:

Having said that, I have no problem with folks using radios that
have part 90 certification whose specs meet or exceed their part 95
equivilant.
One just can't simply change out components and automatically
achieve part 95 certification.

Ryan,

you are on shaky ground on your second statement. But dead on with the first.

You might be taking this section of part 95 to the edge.

Sec. 95.129 Station equipment.

Every station in a GMRS system must use transmitters the FCC has certificated for use in the GMRS. Write to any FCC Field Office to find out if a particular transmitter has been certificated for the GMRS. All station equipment in a GMRS system must comply with the technical rules in part 95.

I think the issue folks are getting stuck on is the converting mobiles to repeater use. I gather that it is thought converting voids the type acceptance. I used the word convert, It is the transmitter that is type accepted for part 95. To turn a mobile into a repeater the work to do so is done on the system board or mother board. You do not have to touch the TX. And in the case of the Mastr II line the mobile TX board is the same part as the station. If you use two mobile units and do not do a duplex mod then you have not touched it at all! For part 95 repeater use the TX must be 0.00025% and for mobile 0.0005%

This is the only distinction from mobile to repeater.

Sec. 95.621 GMRS transmitter channel frequencies.

(b) Each GMRS transmitter for mobile station, small base station and control station operation must be maintained within a frequency tolerance of 0.0005%. Each GMRS transmitter for base station (except small base), mobile relay station or fixed station operation must be maintained within a frequency tolerance of 0.00025%.

was done on my own time and on my own. Very easy to do via online instructions.

The GE Mastr II line of radios are part 90, 95, and other parts accepted. I actually did the research before I bought some cheap gear online. And since the
Executive II's go for a small cost, I bought a second one for backup. If the main unit goes bad, just swap out the ICOMS (crystal modules) to the backup unit while I repair the main unit. And the repeater is not off the air for more
than a few minutes during the switching process. Just plug-in-play.

Back to whether your radio should be FCC type 95 accepted or not: The bottom line is this. If the radio was build to Part 95 specs, and approved by the FCC
for part 95 operation, then there's no questions asked. If you bought a radio
that is not approved by the FCC for part 95 operation, but you modified the parts and internal operations to specifially meet and exceed the requirements
that the FCC would approve of, then I would assume that it would be okay to use
it.

To be safe, and only if you really want to, write to the FCC office or call them and arrange a scheduled appointment for an agent to take a tour of your repeater facilities to see if your equipment meets and/or exceeds part 95, and
if the FCC approves it's operation. (or don't tell anyone and let the guilt hang on your conscience). But I prefer to try finding radios that are already
approved for Part 95 or meeting with an FCC agent at your repeater facilities to
approve such operations.

(2) P94ZRC90A2AA
(1) P94ZPC90A2AA

Used, they come with antennas and batteries with the spring loaded belt clips. No guarantee on the condition of the batteries The radios power up, beep, and seem to talk to each other, no gurantee other than what is stated above. $100 for the lot + $15 shipping. First email ready to pay with paypal gets them.

Thank you Kevin for your input and you are very correct! I am glad to see that someone did find the information that really is required to bring the transmitter on line as a repeater! It is the frequency stability of part 95 repeater use. The TX must be 0.00025%. The Old Micor transmitters do this by using what they called a high stability channel element. The element can and has been used for both base,repeater and mobiles.GE the same as well as others. It takes research. I thank you and I believe the real question that the original poster was "considering buying a GMRS repeater" and if we have not scared him off then I would be surprised. To those that like to build repeaters you could join the repeater-builders group at yahoo as well as visit their web site to get help building one or you can go to Kenwood,Motorola,M/A,Icom and many more for a brand new repeater. When in doubt seek the advice of some local GMRS people or some local radio shops. Just remember to add a controller to your repeater so it will ID so we know who's repeater it is!
Good Luck Steve

Hello to the group! I have had my GMRS Repeater and Simplex programmed into the City of Cleveland, Ohio Fire Command Center Vehicles. We have a LARGE REACT Group using it . The frequency was programmed into their line up by the company that installed the equipment only asking my approval. The city was presented with documentation on the group and list of contacts for mutual aid if needed. Hope this helps!

Bob,

The key phrase in the above part is "meet and exceed the requirements that
the FCC would approve of".

If you read the entire email, you would understand the conclusion of my
thoughts. As with all of my emails. I start by making a point, then contradict it
with another, and then finally conclude with a final point or closing of the
email. But most only read the final part, then snip and quote me on that part.
Not exactly what I originally said.

I've also been out of town for three days, so I don't know what anyone else
has said about my posting. So I will say this... Read the entire original
posting, then make a comment about it. Not scan thru the interesting parts and hope
for the best. Or don't quote me at all.

Topic: 11348 Message: 11376

Kevin,

I realize that, and wanted to show other users what could be done. But I never said that I did that. Out of every posting and email that I have written in this group since I first joined in 2001, I have never stated that I operate equipment that is not part 95 accepted for GMRS. I only stated what You are suppoed to use and what other options you have if you bought equipment that was not type accepted.

So if you're saying that I use other type equipment or agree with using modified equipment to make it legal, then I expect an apoligee from you.

Because that Is not what I do, nor do I stand by. And every part of my repeater has been reviewed by several GMRS organizations in my area, and I have done extensive research before purchasing the associated equipment to be used with our system. All transmitters are part 95 accepted, and all parts are used and compatable with part 95 as well as other radio service parts.

Howdy Ryan

I understood your post. Using the above logic (in it's entirety by
the way) however, one could take a ham radio, put in a few parts to
make stability and purity spec and voila, have a part 95
certificated radio. As you know, this isn't allowed. Same thing
for any other non-part 95 certificated radio. If its not part 95
then technically, it can't be used...period.

Also, within the FCC database, the certifications various radios carry are listed and thus an "upgraded" radio wouldn't appear. Tell the FCC field rep that you "fixed" the radio so it's part 95 compliant...I don't think he would like it much.

Now my opinion is that if a radio meets part 90 then it should also be part 95 certificated. But just cause I think something should be so doesn't make it so. The exceptions are of course repeaters and full blown base units where the frequency tolerance is 2.5ppm in GMRS.

Not trying to bust ya, just that a person can't make a purse out of a sow's ear...or radio. LOL

Hey Bob,

It's all good. That's one thing I hate about writing. You can't express your thoughts correctly and sometimes you read it wrong or take it the wrong way. I understand what you're saying, and agree 100% with your thoughts as well. Can't take a Part 85 and turn it into a 95, or another service and hope for the best. I think I meant to say what you finally said, but in a different way.

Plus, with moving my grandparents up two states and driving back and forth, I think it got the best of me. You by chance in the L.A. (So Cal) area? I'll be visiting the area in a month or so...

11380. GMRS REPEATER USE IN LOS ANGELES

Yahoo group: GMRS (2005 — 2007)
Date: 2006-04-21 00:42:11 UTC
From: Kurgen99
Topic: 11380 Message: 11380

Hey all. I'm sorry if this is a stupid question, has been answered before, or if I've emailed or talked to you on the phone about this already.

I've been thinking about buying a GMRS radio for a number of years, but had no real use for one.

However, I live in the Pasadena area and my wife works in Culver City. We have decided to find out if GMRS radios would help us communicate in case of emergency. Does anyone know of a repeater that would facilitate this goal?

Even between Pasadena and the USC area would be of help to us.

We would only use this where cell phones were not working, and I'd be happy to join or contribute to any CREST or REACT group.

Thanks for any help!

I live in Arcadia and I have heard someone talking on what seemed to be
a repeater. I believe that it was around last Christmas that I had my
simplex GMRS in scan mode one evening. From the conversation, one
person seemed to be on a mobile station driving near LAX and the other
was on a fixed station, perhaps in a 2-way radio shop.

Although the FCC does not now issue GMRS licenses to non-individuals, many groups/organizations have legally maintained their older GMRS licenses.

But I never stated that any "group" was involved in ownership of the system I mentioned....

"legally maintained" ??? Is this why you and others involved with RUG, SCRC Corrona-Norco and Crest and/or you,lied and gave false information on renewal applications that YOU SIGNED>?????????

The FCC is revoking many group/organization, and non individual licanses, including some RUG, Crest, ect, licenses.

Why contribute to the RUG or Crest, there are several GMRS repeaters
that cover the area you need that are NOT owned, maintained, or
corrdinated, directed, listed, by, RUG, Crest, SCRC or REACT.....

RUG, & Crest, ect do not have any corrdination rights, PERIOD they
are NOT the repeater gods they would want you to belive.
The can not even clean up there own act.

"It is THIER repeater" ??? Not always SO... Most all repeaters that RUGites and Cresties try to control are privatly owned.

Using a repeater with out the owners permission is Grand Theft in California, right up there with theft of utilities.

So, why put up with the dictates of Rugies, ect, there are other better GMRS repeaters one can use.

11390. Build a GMRS Repeater for under $300

From: Chris
Topic: 11390 Message: 11390

For under $300 you too can have Type Accepted repeater up and running. Here is how I did it. I purchased a pair (2) of used Motorola M120's for $90.00, that were in very clean and in good working condition. I had them reprogrammed to the GMRS freq (including the receiver PL) I wanted for $10.00, each. I then built an interface cable utilizing the 16 pin socket/s on the rear of each radio. (RX audio, TX audio and COR is on those pins.) The cable cost less then $14.00. I had to purchase a duplexer, which I found on eBay for $80.00 and paid another $30 to have it tuned. A 12 amp surplus power supply was $25.00. So, for under $300.00, I now have a nice working repeater, running 18 watts out of the duplexer, more then enough power to cover the area I wanted. I'll add a couple of pictures of the finished repeater, in the photo section.

For the antenna.. I modified a $5.00 garage sale Radio Shack "base scanner" antenna. I cut the center element and the other three (3) ground plane radials to 2' & 1/32", which represents a full-wave GMRS antenna. Even though I mounted this antenna in my attic (which is where the repeater is located), the antenna itself is strong enough to mount outside. Does it work, you ask? Yes! Nothing beats a full wave antenna and no SWR. Total cost for the antenna if you did not have the parts, would be under $5.00

Happy Repeater and Antenna building

Over here on the right side of the USA, we try to all get along and allow active GMRS license holders to use the 2 systems in the RICHMOND VA area. And if they are new to the system, we verifify them thru the FCC data bank....

Just my 2 cents

The Motorola M120 radio is NOT FCC Type Accepted/Certificated for use
as a repeater or base station in the GMRS.

The radio does not have to be Type Accepted/ certified
for repeater or Base use..
It just has to Be Typed for the GMRS service
PERIOD.. I have not checked to see if it is or is
not..

Next a good duplexer well cost between $200-$400
dollars..the average UHF Duplexer worth anything found
on Ebay is around $375

OK Checking the M120 Datasheets and the FCC data...
the M120 CAN be USED in GMRS Service and CAN be
USED
as a GMRS Repeater...

My Bet is this repeater Complete
with Duplexer cost over $500

One can find Dandy duplexers for well under 200, even under
100 that will do just fine on GMRS.

Of course, if you just are dying to pay 400, I will send you
a paypal invoice.....

Otherwise, much cheaper.

11396. Some people just can't let it go

For the record, you are incorrect in stating Mr. Bradford signed anything with false information on it.
You have gotten your message across to the group - you dislike RUG, REACT, CREST, and anything else that spells S-U-C-C-E-S-S. We understand you were unable to maintain your REACT team or teams and they are now defunct. That doesn't mean others will follow suit.

The GMRS system in Southern California is alive and well and friendly to visitors to the area wishing temporary use during their stay with prior approval. Unfortunately for you, troublemakers are unwelcome thus your unpopularity.

The RUG system is managed in an efficient manner and has done so since 1982. Some of the repeaters are owned by REACT teams while others are owned by individuals - usually REACT members. Despite your continuous harassment of the local FCC office over petty and inaccurate information, the system and it's members are happy with the GMRS service and dedication to public service it provides.

Now I really would like you to find a better forum for your repeated outbursts to create ill will toward the organizations in SoCal. It hasn't worked; it won't work.

While I am proud to sign my posts with my real name, I remain

Respectfully,

Ed Greany, President
CREST Communications REACT Team
Member of Repeater Users Group (RUG)

Isn't there something about base stations needing to have better stability than what is required for
non-base units?

This message was sent using IMP, the Internet Messaging Program.

Yes, but only as far as stability of the transmitter. As for a radio being certified as an actual repeater for GMRS no. The section that covered the stability was provided by Kevin King a while back and here is the part covering it. As for duplexers they can easily be bought for under 200.00 as long as you don't mind older equipment.

First of all Ed, what Jeff posted is the truth..and you are a liar!! Clint Bradford did sign the renewal application as to the fact that the KAD3271 repeater was located in Anaheim on Euclid. He knew at the time he signed that document that the repeater was on Santiago Peak. You guys that run RUG and Crest are some of the most un-ethical people I have ever seen. By the way..I don't know who Jeff is and have never met him. The information he posted was the truth. Like I have posted before, not everyone in RUG and Crest are liars, cheats, backstabbers, un-ethical, glory grabbing, CB misfits like the leadership of Crest and RUG are. How long has the current treasurer of Crest been serving...any new blood there yet?? Should we bring up the subject of government employees spending taxpayer money , time and equipment on maintaining Crest and RUG repeaters...?

ED GREANY <crest25@verizon.net> wrote: For the record, you are incorrect in stating Mr. Bradford signed anything with false information on it.

This is true

>The GMRS system in Southern California is alive and well and friendly to visitors to the area wishing temporary use during their stay with prior approval. >>

I have visited in Calif a few times and well before hand I had contacted Ed about using there system gave my callsign and expected dates while in So Cal. of the times I did go even though I contacted him in advance I didn't have time to come up on the system. but at least I did receive permission in advance if I did need to get on the system.

I am tired of hearing bashing of Rug, Crest, etc or what ever else exists out there. as well as others I am sure.

The time I did get on the system the people were friendly.
what more could someone ask for?

Yahoo group: GMRS (2005 — 2007)
Date: 2006-04-25 23:49:54 UTC
From: Kurgen99
Topic: 195 Message: 11411

Moving down the path to getting some radios, I decided to check out the FCC site, and I ended up applying and paying online.
Using the online registration was very, very easy.
I printed out at least 30 pages of stuff in preparation of doing it all through the mail, but the "Universal Licensing System" makes it an easy 3 step process. All I did was basically get the FRN online, then type my name twice and pay with my credit card.
I know most, if not all, of you have your licenses already, but if you were ever helping a new person like me, or thinking of getting a different license, the ULS was really convenient, and very, very straightforward.

11414. UHF Maxon radios

Yahoo group: GMRS (2005 — 2007)
Date: 2006-04-26 13:11:44 UTC
From: Blake Bowers
Topic: 11414 Message: 11414

I have a about 7 UHF radios, both Ericsson and Maxon 2850 units. (They are both the same - just a different label)

No chargers, antennas, or batteries, but they did work when tested last year. Make an offer, they should do GMRS just fine.

11415. Re: Digest Number 1636

have 8 UHF units.

I will make a deal. All the units I have, in will throw in
a battery or two (No idea if they are good or what) and
a couple of antennas, for $150.00 today.

That includes shipping.

Such a deal.

From: kvsp1160@aol.com
Topic: 11410 Message: 11417

I agree with Jeff and know and talk with Ed on the side. Very helpful and friendly with RUG and CREST from the present and past experience. I have also worked with other staff members of CREST before I met Ed, and I have not had any problems with either experience or time.

As I mentioned from past posts, unless you have personally met Ed Greany, RUG or CREST staff in person, face to face, do not start to judge their actions or how they operate. What is said on paper is sometimes misunderstood thatn what they really meant to say in person.

I highly recommend RUG, REACT, CREST and their staff for any events, repeater, and other GMRS/ARS activities that you may need in the future.

As for this bickering in this group, email your concerns to the closed parties on the side and don't include us in it. It's not mature-like, and not any of our business. They have high respect and high recognization for their excellent job and service to the community and surrounding areas from myself as well as many other persons within this group, other Yahoo Groups online, and private/public organizations within the state of California.

11423. GMRS Approved?

Yahoo group: GMRS (2005 — 2007)
Date: 2006-05-01 19:45:00 UTC
From: Chris Catotti
Topic: 11423 Message: 11423

I was looking at Ebay Item number: 7603249627

Icom UHF F621 45W mobile radio NEW GMRS F-621

The seller replied to my question about FCC Type ID is:

FCC IDENTIFIER: AFJIC-F621-2

Name of Grantee: ICOM Incorporated

The FCC database

https://gullfoss2.fcc.gov/prod/oet/cf/eas/reports/GenericSearch.cfm

shows:

FCC Rule Parts Frequency Range (MHZ) Output Watts Frequency Tolerance Emission Designator
90.210 440.0 - 490.0 45.0 2.5 PM 11K0F3E
90 440.0 - 490.0 45.0 2.5 PM 16K0F3E
90.210 440.0 - 490.0 25.0 2.5 PM 11K0F3E
90 440.0 - 490.0 25.0 2.5 PM 16K0F3E
90.210 440.0 - 490.0 4.5 2.5 PM 11K0F3E
90 440.0 - 490.0 4.5 2.5 PM 16K0F3E

So I guess it is Land Mobile Radio Service (LMRS), nor GMRS certified.

Chris - the radio is an ICOM IC F-620 series, ICOM started mfg 2003 as a LMRS radio plane and simple!

Check out the following ICOM URLs for the info you need.

http://www.icomamerica.com/land_mobile/mobileuhf/icf620.asp

http://www.icomamerica.com/search/default.asp

While they can be modified to function, illegally, on the GMRS RFs. they are not type certified for GMRS. My guess is a "Mod" may have already been done to them to enable them to work the GMRS RF.

My experiance has been that most radios which list a frequency range such as this:
IC-F620/F621 440?490MHZ

Will operate in the entire frequency range listed without any modifications.

This message was sent using IMP, the Internet Messaging Program.

11439. Re: [GMRS] REPEATERS

Yahoo group: GMRS (2005 — 2007)
Date: 2006-05-04 22:45:34 UTC
From: A10382
Topic: 11408 Message: 11439

The NYC metro area can be a very unfriendly area to operate a repeater in.
Intruder/pirates abound..
Foul language seems to be the norm
As soon as you put your repeater on, quite a few unwelcome users may find it and start to use/abuse it.

The ways to avoid this is to not advertise the freq/pl, and use digital PL if you can. Most of the radios (and most of the 'bubble pack' repeater capables) that are repeater capable cannot do DCS/DPL.

You can also use a different PL for input and output if your repeater and HTs/Mobiles can handle that.

You can also use a different pair of in/out freq combination - not the 'normal' ones.
There does not appear to be anything in the rules to prevent this.. i.e.; 467.675 / 462.650
=====

11441. Re: [GMRS] REPEATERS

Yahoo group: GMRS (2005 — 2007)
Date: 2006-05-05 05:41:38 UTC
From: John Soto
Topic: 11408 Message: 11441

The problem with using different frequency pairs is that you cannot monitor the normal output frequency BEFOUR transmitting..
example:
467.675 / 462.675 normal pairs
467.650 / 462.650 normal pairs

467.675 / 462.650 cannot monitor 462.675 as your rx. freq. is 462.650 and you could cause interference on 462.675.. FCC Regulations states that you must monitor befour transmitting.

A10382 <a10382@...> wrote: The NYC metro area can be a very unfriendly area to operate a repeater in.
Intruder/pirates abound..
Foul language seems to be the norm
As soon as you put your repeater on, quite a few unwelcome users may find it and start to use/abuse it.

The ways to avoid this is to not advertise the freq/pl, and use digital PL if you can. Most of the radios (and most of the 'bubble pack' repeater capables) that are repeater capable cannot do DCS/DPL.

You can also use a different PL for input and output if your repeater and HTs/Mobiles can handle that.

You can also use a different pair of in/out freq combination - not the 'normal' ones.
There does not appear to be anything in the rules to prevent this.. i.e.; 467.675 / 462.650

11443. FS: GE Executive II UHF Base Radio - Easy Repeater Conversion

Yahoo group: GMRS (2005 — 2007)
Date: 2006-05-06 08:22:46 UTC
From: kvsp1160@aol.com
Topic: 11443 Message: 11443

Hi Guys,

I have an Executive II UHF base radio (station) for sale. (450-470)

It's in excellent working condition and is operational. It comes with a mic and a pair of 5C ICOM's, and is also ready for repeater conversion if needed. However, the UHF is missing it's amp (can easily be replaced).

I also have Versatone parts and controllers that fit into the Exec II base units.

I'm asking $40, plus shipping via USPS or UPS.

Any questions, please feel free to ask.

The following repeater is up on eBay for sale. I can't seem to find a descriptive, technical link on it anywhere. Anyone have experience with it? The seller states the power cord is missing, (Is it something special?) and the control head is missing. Any help finding out about this product will be appreciated.

Thanks

Single channel 444-470 MHz complete with duplexer, very compact unit less then a 12" x12" space, runs on 12 volt power ! ideal for car or truck ! Ant. conn is BNC . We can program to your channel and pl tone , Would be very useful as a Emergency Repeater on a remote site ! This is a new unit and very hard to find , Thanks for looking ! ps we also have found the blue heavy padded carry bags for these ! $75.00 each to the winning bidder. Ebay Item number: 7612149222

"missing cord" is usually code for it really doesn't work (seller is looking to absolve themselves of any knowledge.

All too often an item is listed as in 'perfect working condition', with the seller's caveat that he/she is "unable to test due to a missing antenna, power cord, power supply, mic, etc., ad-nausea.

Caveat emptor - let the seller beware.

Our GE/MaCom tech saw this and besides saying " 'Let the buyer
beware'", said "the radio is NOT type accepted for use as a repeater
or base station on GMRS.. PERIOD
Save your money."

Hi Guys,

I have an Executive II UHF base radio (station) for sale. (450-470)

It's in excellent working condition and is operational. It comes with a mic
and a pair of 5C ICOM's, and is also ready for repeater conversion if needed.
However, the UHF is missing it's amp (can easily be replaced).

I also have Versatone parts and controllers that fit into the Exec II base
units.

I'm asking $40, plus shipping via USPS or UPS.

Any questions, please feel free to ask.

73,
Ryan

Which one are we talking about? the eBay auction or my posting?

The Exec II is part 95 accepted as well as other parts, as was described in our last argumentive postings.

The eBay posting comment got mixed up with the replies to my posting. If you're referring to eBay's posting, please start a new subject heading.

Thanks & 73,
Ryan

From: kvsp1160@aol.com
Topic: 11443 Message: 11453

The GE Executive II uses two seperate transmit and receive sections that work independantly from each other. They can be used as built for a base station, or with a clip and a small jumper on the SAS board, can be converted to a repeater-operated system. This allows the transmit and receive to operate by themselves, the same as two seperate radios would in a scratch-build repeater.

You also have two seperate connections for your antenna, or duplexer. One input and one output (which is used by the antenna combiner located on the amp).

The SAS board has direct strip connections for repeater controllers, tone panels, and other extra connections if desired.

I'm using a Zetron Model 38 with my system, so it covers all aspects of control, tone, and ID, etc that I need.

The Exec II uses crystals for it's frequency control, and is also independant from each other. They are located on modules that can be removed or swapped out with ease (no resoldering).

Once your Exec II is converted into a repeater and is on the air, it's very easy to test or repair the unit on site. Each component has test points and control points that allow you to hook up your equipment to check your status of how your signal, etc is operating.

And yes, as described from before, and also by checking with several websites and personnel, the Executive II is FCC accepted for parts 90 and 95. This referrs to the transmitter, but all other components are type accepted as well.

The amp is easily able to tune down, if you have one, or once you aquire one. Most come with the 60, 85, or 110w amps. But I recommend the 60w, which can run between 38-64 watts.

Any questions about my posting on the UHF Exec II that I have for sale, please let me know. I also have a VHF Exec II for sale as well if interested.

Subject: [radios4sale] FS: SP50 radios, UHF, LOT of 6 units, $310
Shipped.

Hi all, it seems I'm on an SP50 roll of late, found a few more as
follows:

Have a total of six (6) radios in UHF 450-470MHz with five (5) standard
rate chargers, antennas, batteries, all used equipment.

-one 10ch unit
-four 2ch units
-one parts/repair unit

OK the good first. The first 5 radios look good, only a few chips on the
battery doors here/there, but latches are intact and working. Radios may
have some
use marks, scratches, tape, names, etc on them but are not at all abused.
Overall condition is rated as good.
Radios were tested for TX/RX and sound good, work fine. The only
deficiency is one radio has a speaker that seems to rattle at higher
volumes.
[That radio was tested in another housing and worked flawlessly, so a new
or used front housing will cure anything wrong there.]
Includes radio/antenna/battery. Batts are used but not too old, and may
have useful life.

Next, the parts unit.... a 2ch model, and it works. Will TX great, but RX
appears to be a combination problem of a bad housing/speaker and probably
a bad
audio amp. Tested in another case, this radio's audio did not change. It
is working, no distortion, but low rx audio. Case looks OK, batt door
chipped
and catch missing. Antenna included, but no battery.

Lastly, there are 5 standard chargers and charging stands,
tested/working, good condition.

$310 shipped CONUS.

Programming available for small fee.
thanks!
Randy

From: Chris
Topic: 11456 Message: 11456

You don't have to spend lots of money on expensive controller, or RICK type unit to build a simple FM repeater, that meets the need of most GMRS* users.

If you are interested in using two Motorola radios back-to-back for a repeater, like the GM300 M110, M120, (*SM50, SM120 are part 95 Certified) and GM3188, I have the correct interface cable for that will allow you to connect both radios together using the 16 pin connector on the rear. This is a factory assembled cable with one end marked TX the other RX and is basically a plug-n-play repeater system. All you need is to have the TX and RX programmed add a duplexer and antenna and there you go. Incidentally, I do have a Phelps / Dodge duplexer for sale. It will need to be retuned for the frequency you want. I'll sell the cable and duplexer for $75.00, the duplexer alone for $45.00 or the cable alone for $35.00. Prices include shipping to your door within the lower 48.

I did not say it was on a GMRS channel, What I said it was on a made up channel not a true US channel as per FCC info. It is one of the repeaters we find time to time that the Big M sold the wrong freg on an order and it kills the other repeaters that are on freg of a true repeater. That is all I said that it was not on a true freg listed as per the FCC. And yes you could sell it and the person that gets it can change to a true GMRS channel with a little work.

From: Maire-Radios
Topic: 11438 Message: 11460

I did not mean Motorola some that repeater. It is like we have a condo complex in town that the M people put them on a 469.8990 channel with 2 tone and other data and at the time we had a repeater on 464.900 / 469.900. There license was for 469.875 but when they used it another job of Motorola had problems. So they moved the channel.. It killed our receive. I think they are still there as I have not listen to it in years. We just got a new freg and moved the channel on the repeater.

Hi,

Try Ham Radio Outlet in Sunnyvale, Fry's Electronics on Brokaw in San Jose may carry some, there's another ham shop in San Jose near that Fry's off of 880/101 (forgot the name), and a few others near the city.

If you're in the SF or Santa Clara county area, pick up the yellow pages and look under "Radio Communications". Many shops there. Even some 2-way dealers can order LMRS and amateur radios for you. Just ask.

Is this also why the individules involved in that application, again lied in their reply to the FCC Enforcement Bureau letters of inquiries.
The FCC Enforcement Bureau had asked in many points to explain each and every aspect of the applicants status.

That renewal was refered to Enforcement Bureau last year. That license is history.

I went to pickup My daughter at school last week
and noticed a kenwood Tk3131 radio sitting on the
resceptionist desk... gee same radio I had on my belt.
my next trip will be with a frequency counter and ask
her to key the radio...
If Its on GMRS freq.. I will let the school board they
need new radios or Each person with a Radio will
need their own license. If they fail to comply I will
notity Reilly since I know him personally(he helped me
with an interference issue that got resolved)

11477. Antenna Raising!

Yahoo group: GMRS (2005 — 2007)
Date: 2006-05-15 23:07:05 UTC
From: James Jay Craswell
Topic: 11477 Message: 11477

I know this is Ho Humm news to most of you old timers on GMRS... But!
I put together a nice little ground plane antenna using brass rod and
a back of the set N connector a put it up 15 Ft above our Roof which
is a nice high location. My coverage is great! The kids can't ride
far enough away to get out of range and I'm a happy camper. That said
I need to figure out how to program the tone code recv on the radio
I'm using. Lots of Bubble pack jokers with that stupid bleeping
everytime you talk. And WOW what genius conversations. <sigh>

11478. Re: [GMRS] Vertex Standard Dealers i n Northern California

Kevin and Group,

Doug Quement (Quement Communications) is what I think you're referring to. There is also another shop called Quement Electronics (no relation), but it closed it's doors last year.

As for Quement Comm., it moved from Bascom Avenue (San Jose) to Soquel Ave. (Soquel, CA), and then Doug retired. He took on the job of his dad's after he passed away. Then doug decided to close the shop for good.

I went to Doug for all my needs and knew him personally, but then lost contact.

I'd really try HRO in Sunnyvale, as they can order and program your radio for you, or any 2-way radio shop that advertises as a Vertex dealer.

From: kvsp1160@aol.com
Topic: 11479 Message: 11479

Many on here have posted comments toward others and made ridiculous comments that have either hurt or caused aggression towards another organization from a previous action. I don't agree with that and this should not be happening within this group. It needs to be stopped and to be resolved privately, not involving other parties that were not originally involved in the situation.

With that said, although I agree and disagree with every statement that comes through here, and I also read every post that comes through this group, I do not reply to every post either. If it bothers me, and it should not be repeated within the group, I personally write to that individual to discuss the matter. If the statement from that individual attacks myself, my organization, or my staff and their organizations, then I address the situation privately and apolige to the group as a whole.

It's simple and keeps the group organized and in a manner that allows the group to flow freely without any unnecessary problems.

I fully support GMRS, ARS, LMRS, and every other radio service within the legal aspects of the FCC. I also abide by all rules posted on the FCC website and rulebook, and base my answers on the current and past rules that are located within the FCC website and database(s).

I support REACT, RUG, CREST, and any other private or pulic radio communication organization that is there to assist and provide communications for others in a time of need. I will not embarrass any such organization in this or other group if I have a problem with it. I will take my private matters to them on my own time in a private discussion. It should not and will not be discussed in any way to any other party, nor should any other party be involved within my discussion to that organization unless they were originally involved in that associated matter.

I appreciate everyone here within this group and do not judge them by their actions or how they talk to others. I thank you for your support, discussions, comments, concerns, and other contributions to this group and the GMRS community with the US.

As I have said on here before, I will say it again. If you have any comments or questions about what I said that pertains directly to me, please feel free to write me a private email. If you just want to make additional comments reguarding this subject, then address it to the group.

I heard from who knows where, that you can use a Rat Shack scanner antenna as a GMRS base antenna. And they're real cheap. Or those Rat Shack discone antennas work just as well. I have one of their discone antennas. Worked wonders before I got a Hustler G6-450. So now I use it when I go camping with my other HT's that have BNC connections.

Also use a mast or two and use the bottom of our hitch's bolt and screw on another bolt to it to attach those masts. And then up goes the antenna. Perfect mobile/base communications point for any occasion.

Never old news. Just a way to give us new ideas on how to use our junk in the garage!

Neal,

Good idea on at least PART of your 'plan'. Do try to get the RF frequency with your freq. counter.

DO NOT try to confront the school personel, or the District.

Just collect information and then file a report using the Report form on the Personal Radio group. The Personal Radio group will do the notification to the FCC.

You can still monitor the 'school' radio traffic for aditional information that may be needed by the PRG.

If you can, Neal, what city is this school in? Maybe others here have some additional info.

Don't forget the Personal Radio Group has no real enforcement. Only as much as you have as a person with the FCC.

Try to work it out with the school district and see if they have there own radio shop and give them a call. Also the district may have a business license for the channel, I know by me there are a number of places and govt. that still have good licenses on the channels.

Also the radios may come programmed from the factory that way and just went in use out of the box that way.

Did you say it was a Kenwood TK-3131? if so I will get the info and let you know how the factory ships them.

Maire Radios, You ARE wrong on that statment.
For a fact the PRA does forward the violation information submitted on the form directly to the FCC Enforcement Buerau. THE EB does the enforcement.

One of the main reasons for the PRA Form is to have a standerdized way of submitting the information the the FCC EB, as the FCC has requested.

Form is here: http://www.popularwireless.com/downloads/form.pdf

I believe that you mis-read Maire Radios Message. He states that the Personal Radio Group has no real enforcement and that is absolutely true. Only the FCC has the right of enforcement. And there is NO difference if an individual files a complaint or if they use the form on the PRA site. There are many licenses, as I have been shown, that existed long before the GMRS was changed so everyone from Government to the local construction group to older REACT groups may still have one of those licenses.

11492. Re: Enforcement

Yahoo group: GMRS (2005 — 2007)
Date: 2006-05-17 02:06:25 UTC
From: Ray
Topic: 11469 Message: 11492

It says "Complete all fields to the best of your ability. Please mail a copy of this report to the Federal Communications Commission using the address on page 2. EMail a copy to the PRA using the EMail button above. Submit additional pages and documentation as required. Use Adobe reader 7.0".
The form standardizes all info needed for the FCC E.B. The reason for the email to the PRA is to track all complaints forwarded to the FCC and makes sure that there is some kind of action, be it a simple letter, enforcement action, NOV or NAL's.... and if the person does not want to be bothered sending a letter to the FCC, the PRA can and will forward any and all info to the FCC for them....

My feelings are if they are indeed on a GMRS freq.
they are Educators and should have done their
research.
It would serve them right for Getting Fined.. ,but
until I get a frequency counter on on of the HT's its
all a moot point..
there is a local highschool with a 300 watt Fm station
they feel they dont need an EAS or public file but I
wont go there..
because they are educators they seem to know it
all...

11494. GMRS Repeater

Yahoo group: GMRS (2005 — 2007)
Date: 2006-05-17 02:58:41 UTC
From: neal Newman
Topic: 11484 Message: 11494

OK guys and Gals..

today I was doing some Engineering work for my
friends
AM station.. I found out he actually owns the Tower
site. The FM station up on top is being moved to a
new location. He said it would be cool for me to Put
up a GMRS repeater up on his site(NO CHARGE).
when the Tower crew comes to take down the FM 3 bay
they can put up a UHF stick for me. Heck 200+ feet of
1 5/8 hardline already in place..
OK so now I need a radio to put a GMRS Repeater
together.. what do you Guys recommend.
I see on Epay a GR300? made with 2 radius radios
what Else can be used.. I have an old Spectrum
450-470
repeater sitting in the barn along with a Wacom 4
cavity BPBR duplexer.. that I can retune and crystal
but not sure if its typed for GRMS service.
even a GE MastrII
Suggestions welcome Cheaper is better since I
already have Cans..

Yes Cliff they are Educators and think they know
Everything. along with the mayor.
Besides our Town Mayor is the Communications Guru. so
he thinks...
Yes we have a Mutt Dog for a mayor
afterall his name is Pucci(pronounced poochy) LOL

Clint,

What? Help someone who innocently doesn't know they require a license? It's just too easy for someone to fill out a PRA form and email it. That's it. Case over. Then let the "feds" attack and watch the fur fly. You are correct - it is totally immature and also immature for the PRA to suggest this route to go.

Ed Greany, KAD6554

Clint Bradford <clintbrad4d@...> wrote:
...If Its on GMRS freq.. I will let the school board they need new radios or Each person with a Radio will
need their own license. If they fail to comply I willnotity Reilly...

Why not help the district get legal? Why not do a little homework and see if they are licensed? Why not contact the vendor who illegally programmed them on GMRS and have them rectify their mistake?

Your 'I'm gonna sic the feds on 'em!' attitude is immature and unprofessional. Here's a chance to be a hero - and you're wasting a valuable opportunity.

neal Newman <cozy659@...> wrote:

My feelings are if they are indeed on a GMRS freq.
they are Educators and should have done their
research.
It would serve them right for Getting Fined.. ,but
until I get a frequency counter on on of the HT's its
all a moot point..
there is a local highschool with a 300 watt Fm station
they feel they dont need an EAS or public file but I
wont go there..
because they are educators they seem to know it
all...

I have a bunch of UHF portables and mobiles available.

7 Visar w/DTMF UHF H05RDD9AA4DN with battery, antenna, belt clip & mics
Dual charger for each set of two

PRICE $110.00 each plus shipping

20 Visar UHF H05RDD9AA4DN with antenna only, NO BATTERY, NO CHARGER
FREE Speaker mic for first 13 units purchased (I only have 13 mics)

PRICE $90.00 each plus shipping

1 CDM750 UHF - 25 Watt (450-512 mhz) - AAM25SHC9AA1AN - NO MIC & NO BRACKET

PRICE $110.00 each Plus shipping

1 SM120 UHF - 16 Channel - (450-470 mhz) M34DGC20C2AA

PRICE $100.00 each plus shipping

1 GM300 UHF (438-470 mhz) 8 Channel - 25 Watt - M34GMC20D3AA

PRICE $95.00 each plus shipping

Geeze you guys read what you want But it seems you
did Not really read my Post. you read into it what
your mind wanted you read..

>If Its on GMRS freq.. I will let the school
> board know they need new radios or Each person with
a
> Radio will
> need their own license.

Showing them the the GMRS Rules, and explaining to
them they need to do Either of the above. is
Educating Them.(it may be as simple as reprogramming
the radios and not replace them)

> If they fail to comply I willnotity Reilly...

IF they fail to Comply.. is stating I Have given
them the chance to Correct the Problem and They refuse
to comply with the Rules. the only other choice is to
Notify the FCC..This would be after lets say 30 to 60
days. 2 months should Be Enough time to resolve the
issue.

I also Stated that I would Put one of their HT's On a
frequency Counter. If the radios are not on a GMRS
frequency then all of the above is a moot Point..

To say that its Immature you are way Off base..

You make it sound Like I am going to barge in
Demanding they stop using the radios or I will call
the FCC...
thats nonsense.
I am a broadcast Engineer,also work for a consultant.

and will handle this with Professionalism

From: Ray
Topic: 11482 Message: 11504

Ed,
Most of the time, that's not the case.... There had been Quite a few
occasions where, I personally have tried to "educate" some businesses
that they were not in fact in compliance with FCC reg's regarding
GMRS and GMRS repeaters... I either got blown off or I got an
attitude from the company "officials"... I find that a friendly
letter from the FCC works a lot faster with less grief... I don't
think anyone has received a NOV, or NAL, unless of course they
totally blew the FCC off... and if that's the case, they should get
what they get People may have a different attitude out where ever
you are, but here in the NY metro area things are pretty different

... I either got blown off or I got an
attitude...

I have very few entities the past 14 years who did not pay attention to a helpful, assisting attitude in these matters. And if no cure occurred in what -I- considered to be a reasonable amount of time, the phrase...

'You know, with federal fines possibly running from seven-to-ten thousand dollars daily, plus confiscation of your equipment...we'd better expedite this...'

...gets attention. I have enjoyed coffee and lunches with school district administrators, CFOs of medium and larger firms, and many other entities over the years solving problems...MANY have been cured with just a few telephone calls.

> DO NOT try to confront the school personel, or the District. Just collect information and then file a report...

I've never been a fan of nazi/gestapo/NSA tactics. I'd rather make the contacts myself in person, and help solve problems.

I am also not a fan of folks who lie and hide behind false email addresses in newsgroups like these. It has been my experience these past 25 years online that it is usually untrustworthy folks who hide and misrepresent.

Just my opinion, of course.

Clint Bradford, K6LCS

...how the factory ships them...

Excellent point. Many unscrupulous dealers either do not let some of their customers know about licensing...or, even worse, program radios on freqs for customers without obtaining proper licensing.

Total nonsense. I am amazed when people swallow whole the nonsense promoted by those whose egos run rampant.

I have never needed any self-appointed 'experts' form as I contact the FCC.

Why would you be so eager to let others handle problems for you?

Clint Bradford

Clint, as you can see, as I'm trying to chat calmly to you, i can see a bit of an attitude in your replies... This is exactly what I'm getting at... try and talk to someone or explain something, and poof, an attitude....
I am neither sending flames, nor am i willing to accept any... the only thing I can see that there must be some animosity between yourself and the PRA....
The attitude I can see that is starting here is the same as if you try and talk to the manager of Red Lobster restaurants and get the same attitude only when they get a letter from the FCC that they are using a repeater input and causing interference, these kind of people listen .
A prime example that happened here. A company that is using a hi profile repeater and was spoken to quite a few times, in emails, telephone conversations, and meetings, and yet, nothing gets accomplished, for 14 months. Then suddenly, a letter appears at their front door, POOF they are gone the day after receipt of a letter from a government entity such as the FCC.. No fines, No knocks on the door from a field office, just a simple letter from the Enforcement Bureau, and that complaint originated on a PRA form .

>
> Ed Greany, KAD6554

Dear Ed and Clint, as well as the GMRS list,

Clint and Ed have shared thier opinions, and now it is time I share mine when it comes to GMRS enforcement issues. First, as a board member of the PRA and founder and Coordinator of the Lakes Area GMRS Repeater Group, I speak for myself and both such groups.

Dealing with unlicensed users, as we all know, can be done two seperate ways: by yourself, or by the FCC. The same is done across all radio services. Lets take ham radio. What do hams do to police themselves? Confront the illegal operator and if nothing occurs, report it to the FCC. The same can be said about dealing with illegal GMRS usage. If you have the consitiution to do it yourself, than do so. Be prepared for backlash and harrassment, it is the nature of the beast. I have had both success and failure when dealing with illegal operators, but many included the FCC.

However, we have found that many times the illegal operators simply do not listen to the person who complains about their operations. A responsible licensee then has the option to report the issue to the FCC. The FCC prefers (by telling us first hand) that confrontation with illegal users can be prevented by letting the Commission handle the issue. Unfortunately, we all know how slow the Commission can be, so its best to do some homework first. The PRA forms and assistance with such matters is simply that; assistance in reporting an issue to the FCC. We all know the PRA has no enforcement authority, what the PRA does have is a form that can be used to report issues to the FCC, a form that was reviewed and preferred by the FCC, and a form that has become effective.

Ed, Clint, or anyone else here for that matter, have no right to call anyone immature for trying to make the service better by keeping illegal operations and riff-raff off of GMRS. If a person who feels that there are illegal activities going on wants to report

the issue to the FCC, he or she should have the right to do so; without ridicule or persecution from anyone for doing so.

Unfortunately, we may never see eye to eye on the PRA's efforts in helping its members complete enforcement complaints. Quite possibly, we may never see eye to eye on many issues concerning GMRS. However, by throwing the word "immature" around toward people who are trying to make a difference seems to be quite a contradiction considering the source. Look into the mirror.

I invite you both to discuss this either in open or in private, but ask that the negative tone toward licensees and the PRA for trying to make a difference and keep the service clean cease.

Thank you

Well Clint,
Your apology is accepted.....
I know there ARE differences in our areas... People on one coast's attitudes are defiantly different than another coast (you gotta love New Yorkers).... I still do try to talk to the people that aren't supposed to be on GMRS freqs, as im sure a lot of other people do.... but when all else fails, sometimes you do what you have to do....
I does make sense to try and have a standard form, something that's easy to fill out and send... it is nice to see that a group of concerned people out there, that put a lot of time and money into their systems, could see that there is a way of reporting and compiling data as to the successes of such enforcement when all else fails, and the communication between the offending business deteriate to the level that it does no one any good.... There are people that will not do anything until they do in fact get a letter from the FCC... and that is very unfortunate....

I was in Home Depot today and checked out at the Contractor's aisle. While waiting my turn I looked next to me and a large rack display of FRS/GMRS radios were for sale. They were 22 channel, 99 CTCSS, Uniden HTs and were only $20 for a pair of them. I scrutinized the packaging for well over 5 minutes and not a single word about licensing was printed. I couldn't see the instructions folded up inside so perhaps it said there but that's too late. They would already be in the hands of TWO additional radio operators who could care less about licensing for his $10 radio.

Ed

Clint Bradford <clintbrad4d@...> wrote:
...how the factory ships them...

Excellent point. Many unscrupulous dealers either do not let some of their customers know about licensing...or, even worse, program radios on freqs for customers without obtaining proper licensing.

11522. Non-enforcement of GMRS

Yahoo group: GMRS (2005 — 2007)
Date: 2006-05-18 16:30:01 UTC
From: Kurt Barnhart
Topic: 11522 Message: 11522

Please don't flame me for this message. These are mostly facts plus the humble opinion of someone who has used two-way radios for 35 years and has watched the FCC closely over those years. I have visited their offices in Gettysburg and DC and I am familiar with how these nice people think...

1) Never mind $20 GMRS radios at home depot -- GMRS bubble packs are even easier to buy from Costco, Target, Walmart and on eBay. ANYONE can buy them... kids, day workers, immigrants, etc. If you're clever, you can get them for free (or $1) from friends and yard sales.

2) I doubt that you'd find a retail clerk in ANY of these stores who understands GMRS licensing. In fact, I bet when quizzed, most of them would say either, "no, you don't need a license," or... "well, you're supposed to get a license, but no one ever does and no one ever gets into trouble."

3) The FCC is never going to enforce the licensing of bubble packs. In large urban areas such as Southern California, people routinely use unlicensed 5-watt duplex capable GMRS radios with repeaters and the FCC does not doing any proactive enforcement on them. What makes anyone think the FCC will ever do anything about Buffy and Billy and Pancho when they use channels 15 to 22 without a license? The nice folks at the FCC just don't have the time, the resources or the interest.

4) The nice people who work at the FCC are government employees. As such, they'll do what they have to do to keep their jobs and preserve their retirement. None of them is ever going to become a maverick and make waves. The people who supervise the FCC (members of congress, FCC commissioners, etc.) do not have GMRS enforcement anywhere on their agendas, and don't expect that to happen any time soon.

5) The GMRS and FRS services were put where they are (on a short-range UHF band) precisely BECAUSE UHF does not have the propagation characteristics of 11 meter (27MHz) CB, where skip and linear amps create serious problems. The same kind of problems will never happen on UHF and the FCC knows that.

6) You can argue with me if you wish, but I am convinced that the FCC's mid term (5-10 year) plan is that all serious users (and business users) of GMRS will migrate away from GMRS to business band (they sell those radios at Home Depot too), Cellular or another service. This vision is that GMRS and FRS will be nothing but bubble packs and kids and families and day workers. And if none of these has a license, congress and the FCC really will not care. In the post-911 world, this just will not become a priority for anyone in the federal

government.

7) Those of us who use GMRS probably have a specific reason for choosing GMRS rather than some other service -- Amateur, Business Band. etc. Maybe it's because we didn't want to take a test (like hams). Or we want to talk to our extended family and they don't want to take a test. Or we didn't want to pay the cost of a business band license and business band radios (which, by the way are getting cheaper). If you really think about it, you could get a ham technician license if you really wanted to, or you could switch over to business band if you really needed to, or you could get cheap cell phones for everyone in the family if you needed to(Trac phones are now down to about $8 per month).

8) So.. there is no mission-critical application for which only GMRS can be used. Thus, the congress, the FCC commissioners and the people who work for them are going to be less and less interested in allocating federal resources to protect the old-time GMRS licensees like you and me. If there's something you really HAVE to do on GMRS, I suggest that you start looking for an alternative now (Ham, business band, cellphones, etc.) and save yourself the grief. If you think about it for five minutes, I honestly believe that there is another good solution that will work for all of us.

9) Things are not going to change. As time passes, there are going to be more and more unlicensed users on the entire FRS/GMRS spectrum. Radio manufacturers simply want to sell radios. Home Depot and Target and eBay will continue to sell 10 or 20 million bubble packs a year. We will be more and more outnumbered with the passing of every month and it will be impossible for us to chase down every gardener, teenager, construction worker and hotel manager who is using GMRS without a license.

10) You can post angry responses, you can flame me and you can argue with the nine points I have made above, but I am convinced that this really is inevitable. Maybe I should start making $50 bets with everyone who disagrees with these points. In ten years I could collect on all of these bets and buy a bunch of nice cell phones, business radios or ham gear.

Time marches on...

Good luck!

From: Kurt Barnhart
Topic: 11522 Message: 11523

I forgot to mention MURS.

MURS is another good alternative to GMRS except that you cannot use a repeater. On 151 MHz, VHF propagation is better than UHF on 462/467, and you may be able to work twice as far as on GMRS. You can run up to 2 watts and no license is required. You can use yagis and other gain antennas and the MURS channels are clear an unused in most cities... no gardeners or kids or rouque hotel managers. Unless you need a repeater, MURS is a good way to go. Many serious GMRS users will find it is a good alternative.

Good luck!

==========

John,

Smart move. The truth is that the Ham technician license test is SO easy that one of my ten-year old neighbors recently passed, and his eight-year old sister is now studying for her ticket.

Anyone who passes the tech test with a high score will find the General Theory test is even easier. Only the code requirement is tough for newcomers, and a certain percentage of the population (often people with acute musical skills) will sail through that too.

Just about any serious GMRS users would find amateur radio offers them MUCH more utility and fun. They can continue to use GMRS or unlicensed FRS to talk to their family and can use PL tones to filter out the interference.

I agree with you and can not understand the motivations behind the "radio cops" on GMRS who are worried about every school principal and hotel manager using GMRS without a license. You'd think that they would have better things to do with their lives. It's an uphill battle that they will never win, somewhat like stepping on ants in the desert.

The truth is that, in part, the FCC actually designed FRS/GMRS on a UHF band to give the jammers and goof-offs a place to go where they would not cause as much trouble as they did on 11 meters with linears and skip. It's an escape value that keeps these people occupied and away from areas where they might cause real trouble. The brainiacs at the FCC know this and will never make a serious effort to stop them, because if that was done, those people would probably just get into trouble somewhere else. You'd be solving a small problem and would potentially create a bigger problem elsewhere.

Good luck!

Chris - a well written response to Ed & Clint! I've been setting on the fence for awhile about the joining the PRA. After reading your response I have decided to join the group and help preserve and improve the GMRS system.

We live in an isolated Florida community, surround by miles and miles of the St. Johns estuary. While beautiful to observe it can be very dangerous in either fire or hurricane seasons. We use FRS/GRMS radios in the community to keep everyone up to date on potential emergency situations. One of our home owners, dually FCC licensed, has set up a GMRS repeater (open) for this purpose. By and large the home owners function on their FRS hand sets and receive the information they need in a timely fashion. The GMRS frequencies are used mainly by a group to gather information and then disseminated on to the FRS channels.

Most of the people using the GMRS capable radios and repeater system are GMRS licensed and in many cases, are dedicated hams. It should be noted that the .70 cm band (in which fall the GMRS RF) provides a better "saturation" of RF signal for this community than does the community association business band equipment. In other words, for this particular need and set of circumstances FRS/GMRS is the best solution for the community.

Whether the home owners HT cost $10. or $200. is not really important. What is important is that the information becomes available in a timely basis. The PRA can go a long way in educating the public in the proper use and licensing, when necessary, to help maintain the FRS/GMRS system in a reliable, useable manner! Capitulation to the miss users of the FRS/GMRS system is not an answer!

Good Luck and Keep up the good work!

Dear Kurt,

You are quite mis-informed and I will do the favor of steering you in the right direction. You have your opinions, and I will have mine. So in as much of a respectful way as I can, here I go.

> Folks,
>
> Please read this link and then tell me what YOU think of PRA -->>
> www.prweb.com/releases/2006/5/prweb382228.htm
>
> You can email me privately at LakeHodgesRadio@... if you prefer
> not to air dirty laundry in public.
>
> I was seriously considering joining PRA before I read this
>message. I
> think this press release is very unprofessional (and VERY tacky)
>and
> would encourage anyone considering joining this group to re-
>consider.

Could you cite why you think the press release tacky and unprofessional? Looks pretty good to the many people that have read and commented back on it.

>
> In 27 years in the PR profession, and nine years as a working
> journalist before that, this is one of the sleaziest press
>releases I
> have ever read, timed deliberately to follow the recent press
> campaign by NationalSOS by only a day or so.

In your 27 years in PR and nine as a journalist, did you ever get information on a story after information came to you? As a journalist, you certainly reported news, right? As Americans with free speech First Amendment rights, (something you as a journalist should worship and allows you to do your job) does the PRA not have any right to speak their side also? Does the public not have the right, through freedom of the press, to recieve news and information from two sides of a story?

>
> The radio communications community is a very small community, in
>the
> grand scheme of things. We don't need any low blows, back-stabbing
>or

> public bickering.

Low blows? Back stabbing? Public bickering? From a press release?

>
> NationalSOS has spent hundreds of hours (and recently thousands of
> dollars) to promote the orderly use of two-way radios for
>emergency
> use.

Ah, the real reason comes out....money. Well, the PRA has done so
also, and was around long before the National SOS movement.

>The people involved with NationalSOS are upstanding
> professionals who deserve a lot of praise for what they are trying
>to
> accomplish.

Of this, I have no doubt. Anyone who tries to make a difference is
commendable.

>They seem to be VERY willing to listen to constructive
> suggestions on how they can serve the public interest.
>

Indeed. When this idea first came out, the PRA engaged in very
spirited discussion upon this topic, and as a result, many of the
original ideas have been adapted to be more responsible and suiting
to the common public. They have made some major modifications and
advancements from the original proposal. There is still more
progress to be made.

> NationalSOS is attempting to mobilize trained teams of hams and
>GMRS
> licensees and is working towards a unified, professional effort to
> save lives and property.

Funny thing is, the ham radio community seems to be more
disinterested in this topic. Many ham forums reflect the fact that
hams simply do not want to do this. Regardless, there will be some
that do, and those that choose to do so shall.

>
> If PRA has objections to this, it seems like they should have
> contacted the NationalSOS leadership privately and quietly
discussed
> their concerns, then formed some kind of alliance to work together
> harmoniously to further the "public interest, need and necessity,"
as
> it is often called.

Well, we did actually. We had much conversation about this topic.
Much of the discussion was in open public forums, however there were

many communications in a private nature also in dealing with this issue. The creator(s) of National SOS have indeed taken many of PRA's considerations and expanded on them. You were misinformed, and now are enlightened.

>
> From what I can tell, PRA has only a handful of members after a
> "membership drive" that began sometime around April, 2004.

Each licensee that joins has his entire GMRS family who are automatically enrolled. Anyone who can be considered a station operator under a GMRS licensee's system may also be a member. The numbers are into the thousands now. Honestly, its not a bad start.

> I invite
> any of those PRA members to email me privately and tell me of
>their
> experiences with this group.

I invite you personally to email me privately and tell me of your issues with our group.

>Have they done other, similarly tacky
> things? Are you glad you joined? Do you plan to renew your
>membership?
>
> Thanks for reading this.
>
> Regards and good luck!
>
> -- Kurt Barnhart, California

Again, if you seek more information, I would be glad to discuss things with you in private, or public. We have nothing to hide. For years, the GMRS has had no voice in dealings with the FCC, and we are trying to let licensees have this voice. We invite anyone to check us out at http://www.popularwireless.com/pra.html

Thank you!

==========

Please allow me to clarify this: Two watts (SIMPLEX) on MURS will generally propagate farther than a one-watt GMRS bubble pack or a half-watt FRS bubble pack and possibly farther than a 4 watt or 5 watt GMRS handy-talkie. VHF simply propagates farther than UHF under most conditions -- compare channel 4 or 7 on your TV to channel 20 or 48. Obviously, if you have a licensed GMRS mobile or base radio legally running 25 watts or 50 watts with a gain antenna, it may propagate farther than a 2-watt MURS radio, even one with a gain antenna.

11530. Re: Personal Radio Association? What do YOU think of them?

Thanks, Chris, for your kind message.

Yes, we each do have our opinions and I respect yours while politely disagreeing with you and with the general attitude of PRA about emergency communications as well as the manner in which PRA has chosen to communicate with the mass media.

If you wish to try and achieve a meeting of the minds, you know how to reach me.

Respectfully,

-- Kurt

I'm not agreeing or disagreeing with any one thing in particular, but would like to re-suggest an idea that everyone has been asking but not acting on.

If it does come down to GMRS not being protected by the FCC from misuse and other problems, who (an org or wide-area group) will step up and take responsibility for these actions and help reinforce these actions?

The ARRL did for the ARS. So we have seen the PRSG and the PRA come and go. We hear this ad that, but are unsure of where they stand as far as supporting and helping to resolve US-wide situations that the FCC could care less about.

Most of us have just GMRS licenses and depend upon them to provide communications between their families or organizations. Others have multiple licenses (LMRS, GMRS, ARS, and 11m CB) and still rely just the same on their communication needs locally for GMRS.

Taking the service away or removing the license would be an issue with many of us, while it would not affect others. So who will take a step and help guide the GMRS community of the US? If we complain about issues reguarding interferrences with our systems or illegal uses from others, will you be there to help us til the end? How about new licensee's? Do you have the support that the new persons need, and will you help guide them while they start to enjoy the benefits of GMRS and their new license?

All these and more have been questions that I've seen within this group and other GMRS groups on Yahoo here over the past 5 years. But we, as a group, have done nothing to confirm that there is such a thing or place that can and will support our GMRS community if and when our needs arrise.

Who will be there? Is it the PRA, the PRSG, REACT, or someone new that is willing to start new and take a stand against the odds and challanges and work along side with us and the FCC and give us our dreams and freedom that we deserve from our radio service.

I, for one, am ready to help serve the GMRS community. How 'bout you?

73,
Ryan

I'm probably in the minority... but I'm a licensed user that is heartily looking forward to GMRS being open to all. The reason is because GMRS has been of immense practical value for those of us doing K9 SAR on routine missions where we utilize Rinos to keep track of our team mates. As a former licensed ham operator, I find it painful to have to fork out $80 to the FCC for a tiny slip of paper valid for 5 years and isolation from my non-GMRS licensed team mates who can't afford to pay for this tiny slip of paper. FRS is just not as practically useful given the distances we work -- and GMRS can be used to help save lives.

Isn't it illegal to have GPS data bursts from those rhinos on GMRS frequencies? (i.e. channels 1~7 and 15~22) That radio is considered to be GMRS on those channels because they transmit at 1 watt.

It's awfully tempting to have an organization with communications needs for it's membership to justify moving GMRS back into the "group licensing" or into a "no-license required status". With the abundance of cheap radios it certainly adds to the rationalle (sp). Truth is, for dependable communications, a group such as yours where lives may hang on the edge, needs equipment that isn't "disposable" and that is of professional quality. Also, in mission critical situations, why would you want to "share" your communications channel with the kid down the block that is playing Star Trek on his $10 radio?

I am heavily involved in disaster planning and volunteer emergency services in my area with the Red Cross, CERT, ARES, Skywarn, and others. With the exception of comms within a shelter, GMRS/interstitials/FRS are not an option, and even tho I'm licensed for GMRS, I would not recommend it for primary mission critical communications. What your organization needs is a Part 90 license for your operations. Yes, there will be a fee, roughly $300 on average for coordination and licensing, but you also may be exempt depending on your situation.

Sure, your won't be able to use your Rhino with its GPS features, but hey, do you really want lives depending on cheap equipment and on a shared service? I'll bet your rescue equipment is top

notch...so should be your communications equipment and radio frequencies. Grant monies may also be available for your communications equipment needs.

I wish you best in your efforts.

Regards
Bob, GMRS WPVV845, Amateur KG4WAD, LMRS WPXC892

That's a whopping $1.33 a month for a UHF license...Please know that
GMRS licensing is a steal - considering what others pay for licenses in
the spectrum!

There's a good thread on eHam about this topic -->>
http://www.eham.net/articles/13825

Unfortunately, the thread is tainted by PRA's silly press
release. But read some of the follow-up comments.

No one wants to spend $80 for a license to use a $20 radio. This is
one of the silliest things the FCC has done. Non-radio people are
always amazed -- "Let me see if I understand this. I go to Walmart
and buy a $20 radio, and then the government wants me to pay $80 for
a license? Are you talking about OUR government?" I've heard this
reaction more than once.

As someone on eHam says. the license requirement for GMRS hand held
radios under 6 watts should be dropped (while maintaining controls
for 25 and 50 watts mobiles, base radios and repeaters).

The GMRS band is already open to all, in practical terms. Anyone can
get a GMRS bubble pack and essentially operate whenever they want.
The FCC is not enforcing the license requirement in any real way, and
for the reasons mentioned in the original message in this thread,
don't expect that they ever will.

11538. Non-enforcement of GMRS

Yahoo group: GMRS (2005 — 2007)

>from our radio service.

Just one person's opinion, but...

1) REACT has teams in 49 or 50 states but doesn't accomplish much any more. Their membership is dropping rapidly. Most teams are small, and even the big teams can only cover small local areas. In California, for example, I'd guess that only four or five of the 58 counties have teams that do anything, and their primary concern is NOT policing GMRS -- they do that in their spare time and only when serious incidents take place. Even then, the FCC does not always respond to their reports. The FCC has no real interest in GMRS / FRS.

2) PRA is a dream and a press release mill. You may have read about them occasionally but they have only a few active members despite a membership drive that began around April, 2004. They are adversarial and they have failed to cooperate with other parts of the radio community. A few of their leaders may be in contact with the FCC at some level but expecting PRA to patrol and educate 100 million FRS/GMRS bubble pack users (most of whom are unwilling to listen) is like expecting a 50-member girl scout troop in a small town in the midwest to cure worldwide cancer, AIDS and bird flue with one bottle of aspirin. The horsepower just is not there.

3) Haven't heard much about PRSG. They have a nice Web site but I'm not sure how many people are actually involved with this organization.

4) Starting Something New? I think the people who have tried to do anything will tell you that starting NEW groups is a painful experience. You have to fund the activity out of your own pocket. You get a lot of resistance from the older groups, and the users are mostly not interested in listening.

5) How do 70,000 GMRS licensees compete against 100 million bubble pack users? Do the math -- if each of them joined REACT and PRA and worked full time, 50 hours a week on this, they'd still only scratch the surface.

I refer you back to my nine original points in this thread. Don't expect much to change.

Good luck!

This is the price you pay not to have to
take a test. Why can't you certain few
just leave things alone. We have a nice
group, all are licensed and follow the rules.
Having to license helps keep most of the
'riff raff' off. If all is to much for you, get
the hell out and go somewhere else!

You people make me sick...

11541. Re: [GMRS] Re: Non-enforcement of GMRS

Yahoo group: GMRS (2005 — 2007)
Date: 2006-05-19 15:40:52 UTC
From: Lisa Harper
Topic: 11522 Message: 11541

Primary and official comms are always on VHF frequencies. I'm talking about the ability to easily maintain SA with adjacent teams on a frequency apart from official lines of communication -- or for use during informal trainings. Those of us who have spent any time working in tactical arenas know that the ability to easily pass data over radio frequencies reduces radio chatter and can markedly increase the effectiveness of communications and SA.

Imagine this scenario, someone has been communicating on a Rino and suddenly comms cease. Is that person hurt? We can send someone out to the last known position to find out or at least get in whistle blast range. Sure you can do this with APRS, but only by buying very specific pieces of equipment, having ham radio expertise on-hand, and spending a whole lot more money. Even before some of used GMRS frequencies, we rarely, if ever, experienced issues with frequency sharing with "kids down the road." We could use VHF or cellphone to notify of others of a change of channel, if necessary.

Just thought I'd reflect the minority GMRS community opinion on this issue. I do think that it's inevitable the FCC will make GMRS unrestricted at some point.
Lisa

Craig, those of us that may disagree with some of your opinions are licensed, too, and follow the rules, so no way to kick us out of the family... it's okay to disagree and discuss. This is, fortunately, a democracy.

Isn't it illegal to operate the Rhino's on channels 1 to 7 and 15 to
22 with the GPS position data burst function since the Rhino
operates at greater than 500mW on those channels making them GMRS
radios on those channels? I haven't read Part 95 in a few months
but I recall that the GPS positioning data bursts are only
authorized on FRS. I also recall reading an FCC enforcement action
against a GMRS licensee who was operating a radio station that
generated digital burst, because his radio generated a digital burst
on GMRS frequencies.

The FCC granted Garmin a temporary waiver on this. And, according to Garmin, "Industry Canada has established a license-free GMRS service. Canadian Rino units will now allow users access to GMRS channels. Position sending/polling will also be allowed on Canadian GMRS channels."

Yes, "DATA BURSTS" and or "Digital Bursts" are NOT permitted on GMRS.
Mr. Hollingsworth has sent many Enforcement letters on these "data
burst" violation(s).

Mr. Holingsworth has defined Digital Bursts as "any form of data,
packets, ect, even sent as analog audio tone shift modulation...
He also specifically stated that GStar, Fleetsync, MDC, and other
signaling are not permitted on GMRS.

I thought that just recently MDC was given the "green light" from the FCC.

This message was sent using IMP, the Internet Messaging Program.

Yes and no. The PRSG and other org's have tried to correct the manuf. on that, and are still working on it.

I don't know the specifics of the radio, but having a GPS on GMRS is illegal per Part 95.

Bob,

I too agree with your comments. I am also , involved with the volunteer side of Pubic Safety and Disaster Preparedness. But , I think if some one has a licensees in GMRS. You can let the group use that person licenses. (it called grand fathering, am I correct ????) Please correct me if not. You can move to a higher channel on the GMRS Range if need be.

my 2 cents.

Thanks

Some good points, Kurt.

Personally, the goal of getting millions of bubble packers "legal" has never been foremost in my mind. It is a situation that cannot be solved.

BUT - protecting existing repeater systems' frequencies from unauthorized users is an aspect of this battle that is very "do-able."

Maybe I am missing something Here.
I know digital data Burst is not legal on GMRS.
Yet Digital control Tones are? (DTS)
would Not DTS be considered a databurst?

Sorry but I'm really confused here:

"NationalSOS is attempting to mobilize trained teams of hams...."

Just how is it that you ARE attempting? And I love that buzz word "mobilize".

If a group of amateur radio operators (ie:hams) are trained, then they are already in an Ecomm unit whose leaders respond to authority. You are not them. In 30 years of railroading I have found that to make the train move you have got to talk to the engineer, not the cars. Have you met with the ARRL/ARES leaders? Who have you talked to?

11558. NationalSOS

Yahoo group: GMRS (2005 — 2007)
Date: 2006-05-21 19:54:08 UTC
From: Bob Burns K4RXR
Topic: 11527 Message: 11558

I am new to the group and new to GMRS, so all of this may have been discussed before. If I'm exhuming a beaten and dead horse, I apologize.

At 09:39 PM 5/18/2006, Lake Hodges Radio wrote:

>NationalSOS is attempting to mobilize trained teams of hams and GMRS
>licensees and is working towards a unified, professional effort to
>save lives and property.

Trained teams of hams to do what?

NationalSOS has said that amateur radio operators often have equipment capable of receiving FRS Channel 1. That much is true. However, I was always taught and trained that communications is a two-way street. Let's say a ham hears his neighbor making a distress call on FRS 1. If the ham has the ability to communicate with public safety through whatever legal means, then the distress call can be passed to the proper authorities. But until those authorities arrive, the neighbor has no idea that his call has been heard and acted on.

Unless the ham has FCC-certified transmitting equipment for FRS Channel 1, it is illegal for the ham to transmit there and unless the ham has a GMRS license, it would be illegal for him to transmit on FRS Channel 1 with anything more than FRS-legal power and FRS-legal antennas. So, what I see NationalSOS fail to mention is that all of the hams that they want to mobilize will have to buy an FRS or GMRS radio in order to transmit on FRS Channel 1. At this point, I smell a rat. Is NationalSOS attempting to address a legitimate emergency communications need or are they helping the FRS and GMRS radio manufacturers sell more radios?

At 11:20 AM 5/21/2006, wa7zbo wrote:

>Have you met with the ARRL/ARES leaders? Who have you talked to?

According to an online editorial published by Mobile Radio Technology on May 5, 2006, the answer is that NationalSOS has not talked to the ARRL. Dave Sumner, ARRL CEO, says that MRT's questions about amateur radio involvement in NationalSOS was the first he had heard about it. In the editorial, Sumner is quoted as saying "But just saying there's a program doesn't make it so...There would need to be an organized effort to encourage hams to dedicate equipment to that purpose. There hasn't been such an effort to this point...It might be fertile ground for discussion, but up to this point, I haven't heard the discussion."

Glenn Bischoff, who wrote the editorial, goes on to say "Without that effort, National SOS is pointless...I agree with Sumner that National

SOS deserves a thorough examination. Frankly, I'm surprised Knight hasn't already placed a call to ARRL headquarters. Promoting an initiative -- which was announced last fall -- that relies so heavily on amateur radio operators without first talking with Sumner seems the epitome of placing the proverbial cart before the horse."

NationalSOS may be a good idea and I'm sure it will generate some media coverage. I am an amateur radio operator and I have FRS Channel 1 programmed into some of my radios. But I'll bet I'm among the very few who do.

I have tried to not comment, but ...

I am a licensed Amateur and GMRS radio operator. I use blister packs for convenience, and our family has five Icom F21GM's for repeater and more reliable range. I am a Red Cross certifed lifeguard which I use with the Cub Scouts and Girl Scouts, both of which I am a member. Our family GMRS repeater is not on the air yet, but we are looking for a site with adequate coverage (6 mile radius).

I have searched, and the Orlando Florida Radio Shacks, Office Depots, Wal-Marts, Staples, Office Max, Circuit City and Best Buy ONLY CARRY 22 CHANNEL RADIOS. I can not find a local consumer retail store that carries 14 Channel FRS only units. All of them are 22 Channel:

1-7 GMRS (FRS compatable, but still require a GMRS License due to "high power" (<5 Watts))

Channel 8-14 FRS (no license ever needed)

Channel 15-22 GMRS (GMRS repeater output, simplex only, GMRS License required)

Therefore, I generally conclude:

- That any real plan to use FRS Channel 1 is a plan to (mostly) use GMRS radios that are limited to 5-watts and a fixed antenna.

- That (mostly) no-one cares if users have a license to use Channels 1-7 on blister packs (GMRS Interstitials 462.5625 - 462.7125 MHz)

- That I may as well only bother to point out to users that Channels 15-22 require a license, and since they are "GMRS-only" and may "interfere with repeater operation or reception of repeaters", unlicensed users should stay away from using them, lest they get "caught and fined by the FCC".

I run a Midland mobile unit in my truck and often I scan the FRS/GMRS band to get an idea of what's out there. I have found on channel one, almost all activity is conducted by children 6 and under. It ranges from screaming inaudible words to a couple young girls trying out for American Idol. The rest of the traffic on the two bands is a mixture of business both in English and Spanish but I've yet to hear a call sign. I have to believe at this point, whether we like it or not, no rules are being enforced (how could they) and no rules will be enforced in the future. What we are seeing now we saw just before the FCC gave up on CB. I predict that GMRS licensing will go the way of the national 55 mph speed limit, or it will just be totally ignored. Just my oppinion.

(15) 6 Channel

I have 30 Motorola P110 radios available. They are UHF and there are
15 units with 8 channels and 15 units with 6 channels. Now these
radios DO NOT come with antennas, batteries or chargers. Just the
radio. These units were used in a department stor change and the bulk
of them have been painted different colors. So obviously these should
be recased.

These radios have not been bench tested but all power up.

PRICE $35.00 each plus shipping. Paypal accepted.

If interested email me at usedtwoway@... or give me a call at
612-910-0218

Sorry for not responding sooner...I went camping over the weekend. Anyways, to answer your question, yes and no. Grandfathered licenses are in existance but with the limitation that their systems may not be changed...for example no additional units, no change in repeater/base station locations, no change in tower height, etc. These groups/businesses would have to have been licensed prior to either '97 or '99...I forget. Prior to this date, licensees were assigned one channel pair (and the .675 channel pair) if I remember correctly.

OK OK you pulled me out of the woodwork....

There is no "one size fits all " when it comes to communications needs. One community may choose to use one thing another group may choose a completely different combination of things. Some radio services certainly have ther drawbacks for certain types of use.If what a group choose to use works for them and they strive to operate within the rules then Why should anyone dictate to a community what they should or should not use.... I am invloved in a few different volunteer groups, one has a business license for their team operations and GMRS for personal comms, another is an official part of a city and uses one of the public safety freqs asigned to the city, and another is a Ham group attached to a local law enforcment agency. I wouldn't think of telling any of them their choice of two way service is wrong...
How about celebrating the fact that we have so many choices and work to keep as many of those choices around for as long as we possibly can.

As for the PRA and any other group's orgnized efforts & what they are trying to do.. On the question of weather or not those eforts will make a difference I leave you with the following story... Not sure of the author.

A business man was vationing on a beach far from home. He was contemplating weather or not he was making any difference in his chosen profesion. He saw a young boy tossing things into the ocean. Upon closer inspection he realized that all along the beach starfish had been stranded and the boy was working feverishly to toss sratfish back into the water. He asked the boy why he was even bothering to save a few starfish... " You can't possibly save all these dying starfish and there are millions more still in the ocean and your efforts would not make any difference." He satated. The boy simply picked up another starfish and tossed it gently in the ocean and said "It just made a difference to THAT one" The man spent the rest of the day tossing starfish back into the ocean.

Mary

BTW there is someone else who uses the sgreact47 ID from time to time. I take no credit for any other recent posts and will probably not post again any time soon.

The following is excerpted from the ARRL newsletter.

If you search and replace "Amateur Radio Service" with "GMRS," Riley's suggestions can also be applied to GMRS.

Good luck!

==========+++

RILEY HOLLINGSWORTH TO AMATEUR RADIO COMMUNITY: "LIGHTEN UP!"

FCC Special Counsel for Enforcement Riley Hollingsworth advised those attending the FCC forum at Dayton Hamvention 2006 to try kindness instead of confrontation when problems arise on the bands. Hollingsworth spoke May 20 to a nearly full house at Hara Arena, and for the most part he praised the behavior of the majority of radio operators. But, he noted, operators still could be more courteous and less inclined to fly off the handle at some perceived on-the-air offense.

"You need to lighten up and not embarrass the Amateur Radio Service," Hollingsworth advised. "All of us make mistakes, especially with the new features you have on radios today. It's very easy to make a mistake. Hollingsworth said experience has shown him that at least 75 percent of the interference complained about is absolutely unintentional.

In Hollingsworth's view, radio amateurs all too often are hypersensitive and rude. "We have a radar going to detect offenses at all times, we assume the worst in people, we rarely give people the benefit of the doubt," he said.

Hollingsworth acknowledged that "certain problem operators" remain, but the real troublemakers are rarely the newcomers."

"Now, think about it: If what you're hearing annoys you, or angers you or is stupid, use the 'stupid filter,' which is that big knob that will take you somewhere else," he quipped. "It's the largest knob on the radio." He recommended moving to another frequency...

11572. An Open Letter..Repost

Yahoo group: GMRS (2005 — 2007)
Date: 2006-05-29 02:20:18 UTC
From: Chris
Topic: 11572 Message: 11572

I have tried twice now to email a prolific critic of the PRA frequenting this group to no avail. Guess I should just conclude the person has no interest in speaking personally with me about the PRA and our mission. That invitation is open and also includes our other Board members like Chris, that reads this group.
Just so you all know...the PRA has not once filed a complaint against an American family using a bubble-pack GMRS radio on a GMRS frequency. That is a myth frequently used by persons that do not want to see enforcement attention in the GMRS. The PRA's intent is to deal directly with the FCC and Congress regarding the 22 channel radios. As GMRS licensees you should all be very concerned about the future intent of the FCC WTB. The PRA met with the WTB in March. They have a GMRS rulemaking in the works but they would not discuss what is included in that rulemaking. All they said about the 22 channel bubble packs was, "You have to admit there is something compelling about a licensee-free twenty two channel radio," and "there was nothing we could do to stop it. (the radio approval)"

The rumor that the FCC wants to de-license GMRS has been heard before from within and outside the FCC. If licensees want to help preserve GMRS for American families they should consider working with the PRA to accomplish that end. Sitting behind the keyboard arms crossed and a scowl across the face may just raise the blood pressure. What do you want GMRS to become? Do you want to keep repeaters? Do you want a five watt 22 channel simplex-only service? Do you want the FCC and industry to devise for us what GMRS should be? Industry has done as it pleased since the GMRS rules changed in 1999. Industry convinced the FCC to allow 22 channel radios. Now the industry doesn't even make a licensee-free FRS radio. What's going on here? WTB said there was nothing they could do to stop the 22 channel radios but could not explain why they did not permit industry to allow a license-free MURS and FRS combo radio. Now I ask you which radio would have made better sense?

The PRA asked, in a meeting with the FCC Enforcement Bureau Chief last year, the FCC to deal with specific rules violations regarding unlicensed use, commercial piracy, and the so-called "buff group" that have hijacked GMRS repeater pairs in their communities for their own use and whom openly discourage family users from sharing the frequencies. Riley Hollingsworth accepted that responsibility and has worked through a list of some serious rules violations. The GMRS in some areas is much more usable than it used to be. See the PRA Enforcement page and Enforcement FAQ. Get your information from the source before you decide if we are mature enough for your support

Complaints sent to the FCC originate from licensees in the affected communities. I would say a good ten percent of the complaints involved some kind of first contact by the reporting licensee that was rebuffed in one way or another. We are slowly building a national enforcement organization of members that can work with other licensees in the various states to resolve interference issues.

Lastly, I want to encourage GMRS licensees to stand behind their local CERT organizations. Ask the local OEM/OES or other disaster preparedness provider to include local GMRS and FRS resources in a local disaster plan and make your systems available to American families in a responsible, thoughtful, organized, and planned way. The PRA has a document suggesting various ways to approach such an effort at our website.

The PRA positions of various issues can be found at our website. http://www/praweb.org and I invite everyone to visit the website to read through the issues whenever you read criticisms of the organization in this Yahoo Group. So far those critics are not interested in speaking with us and would rather throw verbal rocks over the fence and then run away when challenged. If you have an opinion of how things ought to be done then join in on the discussions at PopularWireless.com. (It isn't fair to the owner of this Yahoo Group for us to usurp his group to discuss the PRA unless he approves so I will do my best to limit my comments here.)

Thank you for allowing my post.

I can't imagine anyone finding fault with the PRA's stand on the legal use of various two-way radio services. This is not limited to GMRS, but includes all radio services available to the general public under the rules of the FCC, and by extension, any other country's radio regulation agencies.

From the PRA web site at www.praweb.org -

The PRA Ethics Statement

The PRA supports the lawful use of the Personal Radio services as defined in the the Federal Communications Commission's Rules and Regulations and the various Communications Acts as amended.

The PRA supports the Basis and Purpose, as well as the Definition of each radio service as written in the Federal Communications Commission Rules and Regulations and remains loyal in this regard during any deliberations before federal or private organizations.

The Personal Radio Association proactively supports and openly defends the core interests of personal radio users before government and private decision makers.

PRA and its members subscribe to an Operating Code of Ethics that is consistent with the FCC's Basis and Purpose for each radio service, all applicable FCC Rules and Regulations, and with an emphasis toward expected growth, continued usability and the cooperative use of each radio service.

PRA promotes cooperation among members and non-members sharing the same radio spectrum in the same geographical areas.

The PRA promotes a Radio Industry Code of Ethics that encourages industry to act responsibly toward the Personal Radio Services.

I think if you look at part 95 rules (FCC) all GMRS repeaters have to be stand alone and can not be link. If you want to do that then you need to go to a HAM repeaters. Also you can not mix GMRS freg with other services. Can not put a phone patch on it also. Check the rules and you will see it.

Hello, We are planning to bring up 462.550 PL and.
I spoke to Matt on Saturday and we agreed to put up the repeater on
his tower. We are planning to link it with 462.600 PL . We are looking for ideas for linking
excluding phone lines and internet, strictly RF. I have a few ideas
but if I can get missing info I can put something together and make
this work. This will greatly increase the range we currently have
towards the north. And also we MIGHT start a REACT group. What do you
guys/gals think ????

Subject: [POLKGMRS] Repeater linking

Hello, We are planning to bring up 462.550 PL and.
I spoke to Matt on Saturday and we agreed to put up the repeater on
his tower. We are planning to link it with 462.600 PL . We are looking for ideas for linking
excluding phone lines and internet, strictly RF. I have a few ideas
but if I can get missing info I can put something together and make
this work. This will greatly increase the range we currently have
towards the north. And also we MIGHT start a REACT group. What do you
guys/gals think ????

I'd be interested in the rule you're refering to when it comes to linking GMRS repeaters to GMRS. This one is often used incorrectly:

" TITLE 47--TELECOMMUNICATION

COMMISSION (CONTINUED)

PART 95--PERSONAL RADIO SERVICES--Table of Contents

Subpart A--General Mobile Radio Service (GMRS)

Sec. 95.141 Interconnection prohibited.

No station in a GMRS system may be interconnected to the public switched telephone network except as and in accordance with the requirements and restrictions applied to a wireline control link (see Sec. 95.127).

[53 FR 47717, Nov. 25, 1988]"

The key word there is 'switched'. It's saying you can't do what's usually refered to as an 'autopatch'. Point-to-point telephone circuits are often used to link repeaters, but they're not 'switched'.

I would be interested in the rule you're refering to.

Thanks.

Ray is correct. Per FCC rules from the 1998 version of the Part 95 Rules:

http://www.fcc.gov/Bureaus/Engineering_Technology/Documents/cfr/1998/47cfr95.pdf

Part: 95.127
Part: 95.181(i)(13)
Part: 95.173

... pertain to the question of this original post. If this is unclear, I have the FCC Part 95 Rules that date from 1996 through 2005, and will be happy to supply you with the proper location and documents.

==========

Luis,

Sounds like you're trying to have fun and I don't think GMRS is a good
place for that.

GMRS applications are very limited, you cannot do linking and you
cannot do a lot of things you can do on the ham bands. 2 meters and
70cm are far more useful. Spend your money a 2 meter or 70 cm repeater
instead. You'll be happier, especially if you want to do some repeater
linking or Echolink.

Join a ham club (or start one) and encourage everyone in your group to
get technician licenses for $5 instead of GMRS licenses for $80.

If you do a GMRS repeater (I do NOT advise that you do), you have to
MATCH the input and output per part 90. Example:
462.550 output requires a 467.550 input.

You worked hard to get your ham license. Use that instead. Your time
will be much better spent.

Good luck!

-- Kurt

I'll disagree with this "Sounds like you're trying to have fun and I don't think GMRS is a good place for that". Actually, GMRS can be a lot of fun. None of us get paid to put up a GMRS repeater, so it's a labor or love. Unlike ham radio, it lets me use my equipment and knowledge to help people who aren't hams. It's always interesting to see how other people are using my repeater.

Now, as for linking... RF could be tricky. I don't think you can link it under Part 95, but there may be some point to point options in other Parts. For example, microwave, 900 MHz, who knows. As with most things technical, there are many legal ways to do something.

While, on their own, many of these options could be too expensive to consider... but then again, if you can get a free ride on another system, go for it. I carried repeater audio over a cable system once. 12 mile path over 12 GHZ microwave. I just had an FM Band modulator and demod. Perfectly legal and fun.

I think we can rule out ham radio bands since you would be carrying unlicensed (amateur) traffic.

There's lots of things people take for granted as wrong. For the hams here: Did you know there's a perfectly legal way to transmit music? That's off topic here, so contact me directly if you're interested.

Please keep the ideas flowing for legal use of GMRS. Yes, ham radio is great. But I want to see GMRS stick around for a long time. That will only happen when people are having fun with putting up GMRS repeaters. If they're discouraged, we'll be left with simplex, and then there will be no stopping the blister takeover.

Not everyone in are little group has a ham ticket, they just dont give a Crap about a ham ticket. My parents and family members are some of the people that would car less about a ham ticket. We will have GMRS for are GENERAL family communications. We live in Hurricane alley and need this service to stay in touch with are non Ham family members in an area that will lose telephone service (it did in 2004, Hurricane Charley) If we get hit with another hurricane. Have you ever been stuck at work and could not call on the phone to your family member that you love very much to check on them? I have been through it before. I am a Firefighter and believe me it sucked not being able to call and check on my wife and family after the hurricane passed.

We are having fun with GMRS. Most of us are HAM radio operators already. I dont know where you are from but I for one think the 2m and 440 bands are more like 11 meter CB in this area without the foul language. We have a good repeater system setup and I hope to improve on it soon. All of us are licensed for GMRS. I will have to renew mine next year and I will.

We already have several linked 2m 440 ham repeaters and have several repeaters that dont even get used. Why would I want to put one of them up? No one has a GMRS repeater here so thats were we will stay.

Be safe , Bryan

11584. Help with Zetron Model 38!

Yahoo group: GMRS (2005 — 2007)
Date: 2006-06-20 06:55:01 UTC
From: kvsp1160@aol.com
Topic: 11584 Message: 11584

Hey everyone,

I have a Zetron Model 38 that I'm trying to program via the RS-232 port, and I can't seem to get it to respond to the computer or find any way for the computer to work with the unit itself. I've tried to contact Zetron and they sent me an application that has nothing to do with the Model 38 programming, but claims that they sent me the right one.

Any help at all, giving me step-by-step instructions or any programming software will be most helpful. I have the manual and the necessary means to hook it up, but I really need to find a way to program it besides using the DTMF option.

Many thanks in advance,

11585. Bubblepack Dillemma

Yahoo group: GMRS (2005 — 2007)
Date: 2006-06-19 15:18:18 UTC
From: Ben
Topic: 11574 Message: 11585

Hi all. First of all.. YES, we do have good professional radios already. So this is not about the merits of "real" radios over bubbles...

Here is the problem. We also had a pair of Motorola T7200 which we used for camping. One of them has gone missing. We need to replace it with a radio or pair of radios and have only two days to do it. The T7200 isn't available over the counter anymore, and we have no time for mail order.

So we need to find the best possible bubble pack.. that we can get OTC in the next two days, and these are busy days!

I'm looking at some big retailers I can get to in the time we have, eg J&R, Best Buy, Datavision.. it seems they have nothing like the T7200 anymore.. the "top" Motorola bubble they sell seems to be the SX700R, a pair for $55-65, much cheaper than the T7200 and a smaller antenna makes me wary.

The Midland GXT635VP3 makes some outrageous claims for range, 18 miles! But Midland has historically been a good company, if the radio does 2 miles reliably and has as good audio as the T7200 then I'll forgive their lies :)

Here is what we like about the T7200:

- Runs on 3 x AA's.. this is the #1 reason we use them when we use them.. we are away from power for days.

- Surprisingly superior range for their class of radio.

- Surprisingly clear, loud audio for their class of radio.

- Motorola "holster" style belt clip is superior for hiking because the holster can be firmly attached (zip tie) to the shoulder strap of the backpack, leaving the radio in the perfect position for operation without having to remove the radio. Radio while in the holster is firmly in place and will NOT fall out. But can be easily removed when needed. We have lost other radios due to inferior clip arrangements.

- Good size and weight for hiking. Larger than most bubbles but not too large. Large in the case of the antenna is probably a GOOD thing, and probably why this radio has outperformed other bubbles we've tried. Really light weight is good...

Any help appreciated..
Thanks!

-Ben

PS: I prefer not to get "throwaway" radios that we will never use after this weekend, so I am trying my best. Ultimately I can get another T7200 mail

order to replace the lost one, and keep a pair of inferior radios as spares, if that's how it goes. But again I want to try my best to get something decent in the time allotted.

I've got both a T7200 and SX700R in my hands, if anything the antenna on the SX700R is slightly longer than the T7200.

11587. Bubblepack Curse

From: David W Proshek
Topic: 11587 Message: 11587

Hello All...I am sure you have discussed this to death, but I have to release my frustration regarding those damn bubblepack GMRS radios that are sold in Wal-Mart, Target, Home Depot, and many other places. I am a licensed (WQEI-828) GMRS radio operator. I am a member of the local REACT and Skywatch associations, and I operate the areas' Neighborhood Community Watch. I utilize a 30-watt Midland UHF radio with outside antenna for the REACT use on 462.6750mhz. However, I use an older 2-watt Audiovox GMRS-2000 for the neighborhood watch, as I am not in the need for the power, and am able to utilize all the frequencies for use. In my subdivision, there are several families who have purchased those bubblepack GMRS/FRS radios, and they let their kids play away on them. Now I have made every attempt to convince them that these are NOT toys, as they are using the full 5-watts of power and on any channel. Now of course their reply is that they bought them for $20 and they are kids toys. Try to convince them otherwise. Because the stores can sell them so cheaply, and they know that most people will not read the manuals that come with the radios, the use of these radios is becoming quite a problem for me and my neighborhood watch. The kids are actually quite rude about it, and the parents could care less. I don't want to have to contact the FCC about it (I doubt if they would do anything), and the parents dont believe me about the laws and requirements for that $80 5-year license. What can you do? I live in a basically rural area, with pockets of these subdivisions. To give you another example of the lack of care about rules...there are some people in my area that use a Maritime bubblepack radios to chat all day long on a Maritime channel. (I monitor Maritime channels as I am a licensed Marine Coastal Station). So I guess what my point I am trying to say is.....Why cant the manufacturers of these bubblepack radios make it very clear on the packaging that these radios require licensing. I would think that the FCC would have some impact here. Well sorry everyone, but I just had to get this off my chest..the frustration is really getting to me.

Hi,

I am a newbee here, name is Stan. I am an old CB hack from years back and brand new to GMRS. But I work on computers all day long so I thought I would toss my two cents in.

The RS-232 programming section begins on page 4-3 of the manual (at least the PDF version I am looking at). There is no special program needed. The settings needed to access the device and get a password prompt are on 4-4 and 4-5. Windows 98, 98SE, ME, 2K and XP all have Hyper Terminal, a small, simple CRT version of a teletype. The cable construction plans are on 4-6 along with the default password you are likely to encounter.

You may be forced to use the DTMF method only to set the port parameters in the device but the defaults you should/could encounter are listed in this section of the manual. If you have a working cable, you should be able to do a little trial and error with Hyper Terminal and get a Enter Password prompt. Hopefully it is the default.

Good luck

Subject: [GMRS] Help with Zetron Model 38!

Hey everyone,

I have a Zetron Model 38 that I'm trying to program via the RS-232 port, and I can't seem to get it to respond to the computer or find any way for the computer to work with the unit itself. I've tried to contact Zetron and they sent me an application that has nothing to do with the Model 38 programming, but claims that they sent me the right one.

Any help at all, giving me step-by-step instructions or any programming software will be most helpful. I have the manual and the necessary means to hook it up, but I really need to find a way to program it besides using the DTMF option.

Many thanks in advance,

Ryan Seregow - WPUI299

Hi David,

Newbee Stan here. I am in the process of chartering a REACT Team in York County PA. I was trying to join an existing team when they failed to recharter earlier this year. I have also been following the dilema of FRS/GMRS Combo radios. They seem to be made with license violation in mind. Radio Shack it turns out, has a bit of history for releasing radio models to the public BEFORE final FCC approval. Rumor is that MURS was not supposed to be an unlicensed band as conceived by planners but RS let the cat out of the bag by selling a few thousand of these units WITHOUT licensing info before the FCC caught them. The decision was made to bag licensing.

REACT has been pushing FRS CH1 as a call/info/emergency channel since 2000. This link presents a very good picture of what is happening now.

http://www.qrz.com/ib-bin/ikonboard.cgi?act=ST&f=3&t=121919

In the meantime you'll have to be creative at taming the kiddies. I hope to learn some good stuff hear and hope I can contribute as well.

Good Luck,

Stan Walters

Subject: [GMRS] Bubblepack Curse

Hello All...I am sure you have discussed this to death, but I have to release my frustration regarding those damn bubblepack GMRS radios that are sold in Wal-Mart, Target, Home Depot, and many other places. I am a licensed (WQEI-828) GMRS radio operator. I am a member of the local REACT and Skywatch associations, and I operate the areas' Neighborhood Community Watch. I utilize a 30-watt Midland UHF radio with outside antenna for the REACT use on 462.6750mhz. However, I use an older 2-watt Audiovox GMRS-2000 for the neighborhood watch, as I am not in the need for the power, and am able to utilize all the frequencies for use. In my subdivision, there are several families who have purchased those bubblepack GMRS/FRS radios, and they let their kids play away on them. Now I have made every attempt to convince them that these are NOT toys,

as they are using the full 5-watts of power and on any channel. Now of course their reply is that they bought them for $20 and they are kids toys. Try to convince them otherwise. Because the stores can sell them so cheaply, and they know that most people will not read the manuals that come with the radios, the use of these radios is becoming quite a problem for me and my neighborhood watch. The kids are actually quite rude about it, and the parents could care less. I don't want to have to contact the FCC about it (I doubt if they would do anything), and the parents dont believe me about the laws and requirements for that $80 5-year license. What can you do? I live in a basically rural area, with pockets of these subdivisions. To give you another example of the lack of care about rules...there are some people in my area that use a Maritime bubblepack radios to chat all day long on a Maritime channel. (I monitor Maritime channels as I am a licensed Marine Coastal Station). So I guess what my point I am trying to say is.....Why cant the manufacturers of these bubblepack radios make it very clear on the packaging that these radios require licensing. I would think that the FCC would have some impact here. Well sorry everyone, but I just had to get this off my chest..the frustration is really getting to me.

From: kvsp1160@aol.com
Topic: 11587 Message: 11592

They are required by law (according to past discussions we've had) to put some kind of notice of a license to be required for that radio on their packaging. If not, then they need to add it on there.

Every time I'm in the store, I keep a close watch for these new toys and FRS/GMRS units, and so far every single one has some sort of notice saying that a license is required. Wether it's in a large print or a small print, it's been on the box or pack in some way or another.

However, if the chance that you really can't see or find it on the packaging without opening it, you can write down the make, model, and and info of the unit and write to the PRA and/or the FCC about it and they will take care of it immediately. I also have PDF forms reguarding this issue, but have not personally used them yet.

But I personally stay away from those things. They give me headaches, and they cause my repeater systems headaches on our outputs. But good luck just the same...

Thanks Pete. It seems the SX700R has swept most of the other models out of the store, there are walls full of them. I had hoped to find a T7400 or even T7100 no such luck even from places that had a good selection in the past.. now have a gaggle of SX700's plus a few even cheaper that I would not even bother with. So I got the SX700R's.

One of the holsters cracked on me already though and had to be taped up :(But the construction of the radio itself seems good enough.

So far so good, you are right they are bigger in person than in the photos, not bad feeling either, and the audio quality is actually well above average for a bubble (maybe not quite as good as the T7200 though). Also another good sign, picking up all kinds of signals as soon as I turned it on which, me being in a major city, there SHOULD be signals on every channel anywhere you go. But other bubbles I have had the misfortune to use have failed this test.. and if they cannot pick up repeaters and mobiles then they can't possibly do well hand to hand simplex.. and they don't. But these receivers seem much better than I would expect and hopefully will have good range (I only need a mile or two reliable).

Anyway we will find out.

Thanks
-Ben

My .02 worth, if you have honestly tried to correct the illegal use by talking to the people involved and then they still want to operate the radios without authority then by all means contact the FCC, give them as much information as you can (names, address etc) and hopefully they will investigate, especially since it is causing interferance with licensed users.

I have just purchased a couple of Motorola sx700s from RS for quick use and the info inside does advise that to use the GMRS channels require liscense. When on the FRS channels supposedly the output is cut to .5 watt and on the GMRS channels goes up to 2 watts (unclear if they are measuring radiated output or not).

Hopefully, when I get my Visar programmed to GMRS channels I can get better distance from them on reception (fingers crossesed).

You can do a simple master reset that puts everything back to factory
default that includes the ability to program via the RS232 port.

Withe the Model 38 powered up, place a jumper on pins 3 & 4 on the
RS232 port. Remove the power to the M38 and wait 30 seconds, then
re-apply power, then remove the jumper and plug in your RS232
cable/computer.

The default baud rate is: 300
password : 12123

Enter Password==> will appear on the computer, enter the password,
then enter.

You just saved me a headache. I'll try that. I bought this thing on eBay, but it didn't include a password. The guy said that he may have had a user password stored on there but didn't know what it was.

I'll give it a try after I buy some spare fuses (blew a couple inside...).

Got it!

The Cobra batteries look a bit different, their (-) contact extends about 7-8mm down the battery body.
And, sure enough, there is another contact in the unit that closes a circuit if the Cobra battery is inserted.
A bit of foil solved this proble.

Sorry to have bothered you.

----- Original Message -----
I got a pack of two Cobra FRS/GMRS units (model PR3580-2 DX EVPC) that came with a set of AAA rechargeables and a charger.

Since the original batteries are only 600mAh, I tried substituting the 800mAh ones I had instead (hey, 33% more juice could not hurt, right?)
Unfortunately, with the higher capacity batteries, the charger's LEDs will not light up so I have no idea if they are bing charged or not.
I do have a standalone charger that I can use but it is much more convenient to use the Cobra one, since I don't have to take the batteries out of the units to charge them.

Thanks,
Alex from Canada.

Frequency in MHZ divided into 2808 will give you the length of a 1/4 wave whip for any frequency. example, 2808 / 462 mhz equals 6.08 inches!

From: w5pj
Topic: 11607 Message: 11607

Greetings -

Has anyone out there had any experience with the Cobra LI6000?

I'm looking for info regarding the power output. I figured out the "LI" part probably refers to the Lithium Ion 7.4 volt battery. However, none of the specs I've seen a various seller's websites give any clue as to the true output.

Ads for Midland GXT600 claim a full 5 watt output and a "range" of 18 "miles". The Cobra ads claim 17 "miles". I wonder what their definition of "mile" is. They might as well say 17 "bananas" and 18 "bananas". This would give a relative range assuming that both companies use the same definition for "banana".

I strongly suspect that Midland saw Cobra's ads stating 17 miles and decided to call theirs an 18-mile radio just to capture more market share. What think you?

I'm looking for true 5 watts ERP and am trying to decide which of the two (LI6000 and GXT600)will yield the best range under identical conditions.

Any and all comments will be appreciated.

Thank you,

PJ

I used to have a few repeater up but now they are down. No activity.

I have a rig at the house and the kids run around with bubble packs. At least I can keep track of them. I have it in the mobile. I think the repeater you might refer to is on .675. I had one up on that and shortly after mine was off I heard this one and never any traffic.

Per my friend that has his licence (mine is in the machine) the repeater in Atlanta has a PL input of 100.0 and is VERY wide coverage. I popped it in the scanner and hear nothing at this time. Matter of fact I hear nothing on ANY of the repeater pairs. I know the scanner works well on other ranges.

Craig,

Yu can use a CB antenna, but depends on what kind it is and if you're willing to chop it apart.

For 462.625, at 1/4 wave, the whip needs to be 6 - 3/32 inches in length. But this will also cover the entire 462.550-725 GMRS band. So you'll need an SWR meter to tune it exactly to your frequency after cutting the whip.

Just a little education on your terminology.

ERP and Power Out are related but definitely not the same thing.
ERP takes the Power Out and reduces it by the losses in any
transmission line (cable) and multiplies it by the gain (or loss) of
the antenna.

GMRS is allowed 5 watts 'Power Out' on the interstitials and 50 watts
on the repeater inputs/outputs.

Most 'bubble packs' won't disclose what their 'power out' is. They
just give some marketing types idea of a coverage range (which is
garbage anyway).

Real radios, with real antennas get the best range.

Be sure you understand exactly what kind of antenna you have before you start cutting. For example you cannot cut a typical roof or trunk mount CB antenna down for UHF use. A 1/4 wavelength at CB frequencies (27 Mhz / 11 Meters) is approximately 9 feet. Mobile cb antennas use coils in the base or center of the antenna to match a shorter whip to the longer wavelength. These antennas won't work on UHF.

Most mobile UHF and VHF antennas don't have coils and are just a plain whip. Those you can cut, as long as you are starting out with an antenna designed for a frequency somewhat lower than the one you want to match.

It would be a good thing if you can borrow a UHF SWR meter so that you can check your antenna after you cut it to make sure you got it right.

From: Danny Harmon
Topic: 11616 Message: 11616

Hi Everyone.
Just joining the group as a new GMRS licensee, WQFE480.

I've used GMRS/FRS continuously since the mid 90's starting out with the Motorola Talkabout 10 Channel, 2-Watt handhelds. (I bought 4 of those for 160 bucks each! Ouch!!) A number of my friends and I use GMRS for railfanning (Trainchasing) usually operating on Channel 4, 462.6375Mhz.

Now I've upgraded to Motorola CP-200's and am now testing the new BPR-40. Both are fabulous units. I realized I should license myself since I'm getting into bigger power.

I'm now shopping for a base unit, but before I buy anything I want to find out what the maximum ERP output is for GMRS fixed stations. The rules I've read say 5 watts, but I've also read posts from people who are running 25 and 30 watts.
Also, am I limited to a 20-foot antenna height? That's probably all I'll go anyway in consideration of my neighbors, but I would like to know the max anyway.

So, greetings from F-L-A. I'm looking forward to the information from this group.

Regards,
Danny Harmon
Tampa

Danny:

A GMRS base station can operate up to 50 watts ERP on the GMRS Channels only. These are the channels not shared with FRS. On the FRS/GMRS shared channels, a GMRS base can only operate with a max 5 watts ERP, and on the FRS freqs, a GMRS base can operate with .500 watts only. I have a 30 watt ERP base station, which I use on GMRS channels only (8 of them).

The other thing to consider is if you are planning to use GMRS repeaters, then I would consider optimizing your antenna for the 467MHz (repeater input/your transmit) frequencies. Good quality GMRS radios will continue to hear well despite the apparent mismatch on the receive (462MHz) frequencies. If you are planning to improve your simplex operations, then I would optimize the antenna length for the 462MHz frequencies.

Topic: 11601 Message: 11621

A quick note... I have used one CB antenna with a center load and adjustable top whip for use on GMRS. I never clipped the whip (didn't want to ruin it), but adjusted it through a SWR and found that it brought out a good reading of 2.2:1. Mind you, I was using the original coax as well as the entire length of the coax provided.

Most antennas that are used for mobile applications, I tend to see people remove the old or long cabling and make it shorter, or in some cases, replace the entire coax for better coax to begin with.

But Ben is right... Don't use those fake coil whips, fibreglass, or even firestik -type antennas. Not worth it.

Hi Danny!

Welcome to the GMRS group. Glad you could join us... So you have a few questions for us, but also need help. Well you came to the right (and one of few) place!

Let's start with the base unit. Unless you buy an old unit from eBay or another used place, many companies don't really make base stations for GMRS, but do however make base stations for commercial use (450-470, Part 80, 90 & 95 accepted, etc). Since GMRS is based on the FCC Part 95-Subpart A, you'll need to find a radio that is accepted for Part 95 use.

Within Part 95 are many rules and regulations that will answer your questions. These can be found here:

http://www.access.gpo.gov/nara/cfr/waisidx_05/47cfr95_05.html

There is a difference between ERP and TPO that many get confused by. ERP is the loss (or sometimes gain) from the power that travels through the coax to your antenna (or for FRS bubblepacks, the loss from the antenna) from your output source (radio, amp, etc). TPO referrs to the Transmitting Power Output which is measured by the amount of power that comes directly from the output of the radio. For GMRS, the maximum TPO is 50 watts. For the FRS/GMRS shared (interstitial) channels, the maximum TPO is 5 watts. For FRS only, the maximum TPO is .5 watts or 500 milliwatts.

For those who run 20 or 30 watts or even the full 50 watts, they may have mobile radios or repeater systems, which require the extra wattage to transmit their signal to the proposed location. On flat ground, 35 watts can go over 10-15 miles and even more. However, on a mountain top, that same wattage can travel well over 50+ miles.

As for the antenna height, Let's refer to the FCC rules in Part 95.51, where it says that if you're near an airport, your antenna height may not exceed over 200 feet. If you have a small base or control station, your antenna may not exceed over 20 feet above the ground or structure that it is mounted on. But if you don't have a control station and are not near any airports, you could (hypothetically) have a 500 foot tower with an antenna on it, or higher!

I only have a 20 foot tower on my property at home. That's all you really need. Plus the height of the antenna (another 8 feet) adds a few more feet to it. Quite nice and blends in with the trees/house.

BTW, how do you use GMRS with the trains? You a foamer? We have some nice SP/UP yards here.

If you have any other questions, please feel free to ask. We're always here ready to help.

What was probably happening there is that the center load was acting as a
trap and you were resonating on mostly the bottom half. Definitely some
voodoo operating there, and I wouldn't expect it to work in the general
case.

11626. Re: Hello from Tampa, Florida

Yahoo group: GMRS (2005 — 2007)
Date: 2006-07-11 01:20:09 UTC
From: Danny Harmon
Topic: 11616 Message: 11626

Thanks to David and Ryan and all the others who replied off-list.
Very useful info indeed.

My aim as of now is to build a base station using some kind of professional transceiver. As you all probably know, there's lots of those for sale on ebay.

I do have a question about antennas; What's the favored base antenna out there right now? I want on that's omnidirectional and relatively light. What about transmission line? I use Belden 9913 RG-8 on a VHF base receiver (for railfanning) and it works great. Will that work for UHF at 462MHz?

Thanks again for all the help. This appears to be an excellent list.

Topic: 11601 Message: 11627

Most likely, but at least it worked.

Ya know, I would just go up to eBay and buy a new 462/467 mobile antenna with NMO mount. They have a package deal for under $50 that includes a 5dB mobile antenna, magnetic NMO mount and 15' of coax. I bought mine up there (replaced that CB antenna) and it works ever so great. I cannot say anything negative about it.

That's what I would do. It would save you the time, hassle, and possible mismatch of your antenna/radio in the first place. Using a CB, HF, or VHF antenna as a GMRS antenna is okay for a short term use (temp.), but if you're going to use it every day, I recommend buying a new antenna that's made specifically for the frequency. Plus you can tune it farther from there with simple instructions that don't require a SWR meter.

Someone correct me with the math if I'm wrong but you know at 2:1 you are radiating 1/2 the power of your radio back into the PA?! At that point you are tossing away power and over time ruining your radio.

> So, to follow up on my bubble pack saga...

PS: Please note, I am not advocating the purchase/use of cheap radios, I have used good radios and am well aware of the value of a good quality commercial radio, and of the shortcomings of the cheap ones.

My entire interest in bubble pack radios is for their frequency/tone agility and ability to run on 2-4 AA or AAA batteries. Sometimes that allows them to be used when other radios that are heavier or require recharging cannot be used...

I am merely interested in making the best radio decisions within the constraints of the situation.

So, please let's not get into a debate about it!

From: Ben
Topic: 11574 Message: 11630

So, to follow up on my bubble pack saga...

As I reported earlier, I misplaced one of my Motorola T7200 bubble pack radios. I could not get another T7200 quickly enough. The T7400 was my next best choice but I couldn't find that either. So I went for a pair of Motorola SX700R radios. $65 for the pair including batteries and charger.

Anyway, now I have had a chance to try the radios in the field and also to look at the FCC reports.

Unfortunately these radios were only just ok in the field. I have had very respectable results with the T7200 and these did not compare. Although the audio on these radios is very good for a bubble, and the construction is good, and the battery life is not bad either. But the RF performance was very much bubble-like.

The radios were used mostly in fairly short range (simplex, obviously) situations of 1/4 to 1/2 mile, in a hilly wooded area. Though the distance was short, the crest of the hill would sometimes block the direct line of sight.

Although we were able to communicate pretty much all the time in this location, it was sometimes noisy, and it is likely that if we had gone further apart (eg 1 mile) we would not be able to communicate.

To be fair, if we were on flat land it would have probably worked better.

My experience in the same location using the T7200's was much better, with clear, full quieting signal all the time.

The FCC reports show that the SX700 transmits only 0.63W ERP in high power ("2 watt" mode) and 0.17W ERP in low power ("1/2 watt" mode).

The T7200 test report shows 1.559W ERP in high power mode and .402W ERP in low power.

The T7400 test report shows 0.98W ERP in high power mode and 0.28W ERP in low power.

So basically although all three radios carry a 2W/.5W rating, of the three only the T7200 comes close enough to be an honest rating.

Unfortunately the FCC doesn't require receiver tests :(
Without those you really can't say what is the best radio for simplex.

But given this experience I would say that yes if you want a pair of rechargeable radios for $65, the SX700R's are not bad, you can certainly do a lot worse for the money. But don't expect more than moderate range.

In my case what I am going to do is keep these for spares and replace my missing T7200 with another T7200.

What I have really hoped some manufacturer would make is a radio that cuts the difference between a bubble pack and a professional radio: Easy setting of frequency and tone like a bubble, compact like a bubble, can run on a sane number of off-the-shelf batteries (4 x AA?) like a bubble, small like a bubble.. but well made and with superior RF (especially receiver) and audio performance like a commercial radio.

11631. Repeaters - What's the main benefit?

Yahoo group: GMRS (2005 — 2007)
Date: 2006-07-11 01:32:44 UTC
From: Danny Harmon
Topic: 11631 Message: 11631

I don't want to bog down the list with newby questions, but I'm very curious.
What' the main advantage of a repeater system in the GMRS application? I understand that a repeater expands the network by allowing all mobiles to hear one another through the base station's power.
However, if the goal of an operation is only base-to-mobile communication, is a repeater of any additional value?

Thanks again,
Danny Harmon

According to my SWR chart, the reflected power for 2.2:1 SWR with an output power of 50 watts would be a little over 7 watts. I was told once by an RF guy that if an SWR meter wasn't available but your meter can measure reflected power (Bird for example), 10% of the output should be the max reflected one should allow.

Yes it is for the exact reason you mention. It extends reliable
coverage for all stations in a given area.

11636. Re: [GMRS] Need help to cut a wip antenna down to a 1/4 wave

Yahoo group: GMRS (2005 — 2007)
Date: 2006-07-12 09:04:19 UTC
From: kvsp1160@aol.com
Topic: 11601 Message: 11636

It was the length of coax I had from my console to the roof of the vehicle. In a Ford Explorer, Ford does not give you many options to route your coax to the roof. So I had to go behind the glove compartment, down along the bottom door jams or both doors, out and up through the rubber door seal, and up onto the roof next to the rack.

The reason for this is to avoid the electrical wiring of my dual 12" subs (500w amp) on the other side of the vehicle, as well as down the center of the console which houses my 6-disc CD changer and a few not-so-well-planned Ford electrical relays for the A/C and rear Fans.

The result is a 25-30 foot coax run which is why I had the huge rating. With my CB rig, it's a different story at almost 3:1.

I'm almost wondering what I'm going to do when I install my ARS rig and my scanner. And no, I'm not going to drill holes in my foor for a NMO mount, although that would save some coax and distance... Any suggestions are welcome though.

Hi Danny,

Just checking my email, so I'm not sure who replied yet, but here's my info bit for you...

I use a Hustler G6-450-3 with a LDF4-50A coax. In layman's terms, the antenna is a 6dB gain, 450-470 MHz, and the "3" is the third model in the G6-450 series of Hustler Antennas. The coax is 7/8 inch heliax coax, and has a very low loss at 462/467 MHz at around 50w. Rated at 100w it's loss is at about .0078 watts per 100 ft (i think roughly). Costs about $800/100 feet, and is highly recommended for repeater use.

For normal mobile/base simplex use or talking to a repeater system, etc, it depends on what the specs are for your RG-8 coax. I tend to stay away from that stuff as they are sometimes cheap to buy and have a good amount of signal loss. However, there are some types of RG-8 coax that have a very low signal loss when used with different material types, but the cost of the coax can be much higher. I'd also try to stay under 50 feet of coax for normal runs. 75-80 at the most, unless you buy the expensive stuff and need to run longer lines permanently underground, etc.

A great portable antenna that I've also used in the field with my GMRS setup, the the Rat Shack multi-frequency Discone Antenna. Receives from 50-1300 MHz, but can TX on 6m, 2m, 222, 440, 800, 1.2GHz. The nice thing is that you can clip and tune the whip portion of the antenna to your desired frequency, and get a nice 2.2:1 or better SWR rating. It sits on it's own mounting mast, but the SO-239 connector is inside the mast, so I recommed using Rat Shack's 3' RG-8 coax with SO-239 coupler as your antenna lead, then whatever coax you prefer to use with the antenna.

The discone compacts down to a nice bundle. The radials grouped together are about 4'(L) x 1" (dia.) and the mast and mounting is about 1'(L) x 3" (dia.).

Anything else you need, feel free to ask. I also have a Motorola 35w mobile amp for sale if needed.

The Cobra 4000 is a good radio. The audio is much better than some of the Motorola bubblepack and, IIRC, the ERP on the high-power (3-watt) setting is 2.1 watts. It runs on 4 AA cells. This model was released a couple of years ago, I really should buy another set before it is discontinued in favour of the more recent junk.

In a message dated 7/11/06 5:41:08 AM, distsig@... writes:

> However, if the goal of an operation is only base-to-mobile communication,
> is a repeater
> of any additional value?
>

Good question indeed. Really, it is. =c) Many people use repeaters for their personal use to talk to another person or family by using a mobile, base or HT (handheld) radio. But if we look at the picture closer, we'll find something more to this. Is a repeater of any additional value?

Many organizations in the US such as the Radio Emergency Assisted Communications Team (REACT), Repeater Users Group (RUG), Citizens Radio Emergency Service Teams (CREST), etc. own one or several repeater systems for their needs. It may range from a friendly chat from one end of the city to the other for business needs, to help direct traffic in a parade or a city-wide event, assist emergency personnel with communication needs, or by having a weekly or monthly net meeting to discuss plans within that organization.

Some systems are open and free to use, while others are closed and are private and may require membership and monthly fees to access the system. Fees are not there for personal profit, but to help support the cost of the repeater site and to maintain the upkeep of the equipment. Many sites are rented and have a starting cost of $400/month. For some, that's cheap.

My business, Bay Area Repeater Net, serves the San Francisco Bay Area in California. We also work with other organizations within the state. Our main goals are to help indivuals and families find repeater systems to use, help build systems for their own use and coordinate their frequency/tones with the existing systems, and we also help coordinate other existing systems/organizations who work together in times of need for a city, county, or state-wide emergency. Our repeater system is a closed-membership system.

So in all, there are many benefits and additional values for having repeater systems around. Without them, you'd be stuck talking to yourself or your next-door neighbor! You also probably wouldn't have cellphones. They are also built on the concept of repeaters.

I have (and used to use) a couple of Motorola T6400's. They work great in the woods and mountainous areas, and seemed to go at least a mile, if not more or less.

Actually they did TX a mile in the snow in the mountains and woods. Lots of reflections and yet I got them to go where I wanted them to. The only thing I don't like are the clips. Everything else is just fine for your basic FRS/GMRS needs.

An NMO mount is the most effective of the options? Is the car leased?

BTW I drive an 01 Eddie Bauer Explorer so lets share knowledge.

>And no, I'm not going to drill holes in my roof for a NMO mount...

It's your vehicle and your radios, so you have to decide which compromises you are willing to accept.

Unless you have plans to sell the vehicle in the next year or so, I'd say drill the holes. Your antenna performance will be much improved over just about any other non-permanent mount. And the longer your keep the vehicle, the less impact the holes will have on resale.

I just recently drilled 7 holes for NMO mounts in the roof of a 2002 Ford Expedition. It took me the better part of a day because I dropped the headliner and took my time laying out the locations (measure twice, no, three times, cut once). I drilled the holes with a Uni-bit step drill, though most installers I've talked to say use a hole saw made for antenna installation like most of the antenna manufacturers sell. I used Larsen plated (not plain brass) mounts with double-shield coax.

I plan to keep this vehicle for a long time and have several radio projects in the works for it. No more mag-mounts. No more snaking coax through doors. No more excuses for poor antenna performance.

Thanks for the replies everyone.

I think I'm going to have to stick with some kind of RG-8 coax. I doubt if I'll ever spend $800/100ft on feed line. That's a little out of my price range...and my interest range. But you never know, right?

I may try one of the RS Discone antennas, though. Sounds cheap, which is right up my alley for this project.

Thanks again,
Danny Harmon

I don't recommend the use of a hold saw for drilling the holes. It's too easy to OOPS. Instead, I recommend a Greenlee hole device. You drill a 1/4" hole centered where you want the larger perfect hole and then a bolt half of the Greenlee goes thru the 1/4" hole and the other half screws onto the first part from the other side. Now just screw down the bolt that goes thru the 1/4" hole and after a few turns, you have a perfect hole sized to the antenna you are installing with not jagged edges. Be careful though, the edges are clean and SHARP. The Greenlee is much like a chassis punch that makes perfect openings for hardware.

Good luck.

Ed

From: Ronny Julian
Topic: 11601 Message: 11650

Check with your body shop but I'm pretty sure that fixing a 3/4" hole is cheaper than fixing a large paint area where the water stands under a mag mount and rusts the body around it. A mag mount scratches the paint everytime it's moved by an outside force (wind, limbs, parking decks, drive thrus) Then there is the water leaking down the coax into the door seal that stays bent over with the coax pinched between it and the door.

I've never HAD a NMO mount leak for me. They probably have for others. I have seen all of the above first hand.

Uh, the Greenlee IS a chassis punch.

In the professional two way world, we don't use hold
saws, we use hole saws that are specifically designed
for antenna mounts.

A very good choice is the Antennex HS34, a picture
of which can be found at

http://www.baproducts.com/hs34.jpg

Not only does the collar all but prevent busting through
a headliner, or other things, it also provides a very good
ground, unlike the Greenlee punch.

The other thing that makes the saw so desirable, is the
ease of use. You only need access to ONE side, where
with the greenlee punch, you need full access to both sides.

At 12:27 PM 7/13/2006, ED GREANY wrote:
>I don't recommend the use of a hold saw for drilling the holes.

The type of hole saw I'm referring to is specifically made for drilling 3/4" diameter holes for antenna mounts. The blade is very thin and has fine-pitched teeth for a smoother cut on sheet metal. The blade holder only exposes about 1/4" of the blade to hold the blade better for more precise cuts. Hardware store hole saws are really made for cutting wood and have teeth made for that job.

Nonetheless, I had good success with the step drill.

I'm familiar with Greenlee punches and they do a good job, too, as long as you can easily get to both sides of the panel where you are putting the hole.

Hi Bob,

I'm sure I don't doubt your statement here, but I live in an area in California where the weather can get rough and very mean. We get high winds above 50 MPH, heavy rains and downpours, and stupid construction workers that think that everyon drives cars and not trucks, and assumes that your SUV can fit in a Mall Garage.

But I have yet to see a single scratch on my roof from the mag mount, water leaking into my vehicle, or any other damage that is caused from what you describe above.

I've had discussions with others about mag mounts before in this group as well as in other groups, but in all the years that I've been in radio communications, I have never seen a magnet mount without a black plastic covering on the bottom to protect your vehicle from the scratching. No matter how old or new it may be. And my antennas never move, nor do I park in home or mall garages.

I'm not flaming you or upset, but saying that although your statement may be true, it may also not apply to others as well if it is done correctly and with proper care.

However, I do have watermarks. But they can be washed off when I get my vehicle washed at the same time. No worries on my part though.

It's not the complaint of the antennas. They're great! It's the long coax run.

I also have a 1997 Ford Explorer, and it's a shared vehicle (not leased though), so I just can't drill holes in the top. No complaints on the GMRS, but I have a high rating on my CB/SSB, and recently re-checked the SWR on it... 3.2:1 !! So I'm guessing that it's either the coax or the long run.

Eventually, I won't have the truck anymore. Maybe I'll use it from time to time, but I'm looking at buying another vehicle by this Christmas for my uses, and the run will be done correctly this time.

Of course, if I told you what vehicle I'm going to get, you wouldn't believe me...

Hi,

I'll add my 2 cents here. I have used mag mounts before and not had water problems. I think the only draw back is that if you rarely or never dismount the antenna, you can get a fade spot that does show up and does not wash off. However, this only occurs with certain colors of paint and maybe the newer paints and finishes used today do not suffer as much. I cannot use a trunk lip mount because the leading edge of the liftgate on my Saturn pivots below the roof line.

Anyway, my solution is as follows. I drive a Saturn wagon. I could use a mag mount but I did not want to bring the coax in around the rear passenger doors which are used often (multiple in-outs each day. My lift gate is not used on a daily basis. I went to the hardware store and bought two galvanized L brakets used to join wood pieces in construction. I plan to anchor them to the lip of the roof where it turns down into the gap for the liftgate. I am going to then mount a 1/2 inch EMT (metal) pipe across the top with a screw/nut through the pipe and into the bracket on each side. This will give me a 38 inch wide 1/2 inch pipe across my roof line just forward of the liftgate. I can then mount as many mirror clamp mounts as will fit (within reason) and run the coax into the gap between the roof and liftgate and through or over the rubber gasket into the car.

OK, that's my plan. I'll take pics and post here if anyone wants to see the project.

11664. Re: [GMRS] Drilling holes for permanent mounts

Yahoo group: GMRS (2005 — 2007)
Date: 2006-07-18 00:27:20 UTC
From: kvsp1160@aol.com
Topic: 11601 Message: 11664

I think the confusion of the water problem is where the coax is coming into the vehicle via the rubber door seal, etc.

In every rubber door seal on most every vehicle on the market, there's always a space or gutter behind the rubber tubing next to where it attaches to the vehicle. I use this space to run the coax from the top of the vehicle to the bottom. Then I enter the vehicle and cross the tubing at the bottom of the vehicle and into the plastic door jam and under the carpet, etc or wherever you're running the coax to. This allows maximum protection from any weather exposure such as water, dust, dirt, and overwear which can produce hard rubber overtime to allow such substances inside.

If you need to remove the coax, just pull and it's gone. No tools needed or tape/glue to be removed. Very easy to install as well. Just a simple standard (#2 or #3) screwdriver to push the coax in between the rubber tubing. Very well hidden and very professional looking.

As for the rooftop, if you have a rack, run the coax on the backside of each rack channel up to your proposed mounting spot and use black electrical tape to seal it in place. Tape lasts for many months and is very cheap to replace.

Hi there,

Welcome. The 5 watt limit is for what is defined as a small base. (some one else correct me if I'm wrong). IF you plan on transmitting on the shared interstitial freqs (ie 462.5625 = FRS/GMRS 1 on a most bubble packs) then you have the 5 watt/20 foot limit. IF however you plan on using only the GMRS freqs (ie .550, .575, .600, .625, etc) including the 467.XXX repeater inputs, then your limit is 50W and a mast or tower is restricted by local ordinaces or FAA rules (200 feet in runway approaches, lighting requirements, etc.)

If you want to do both (small base 5W local and 50W DXIng), construct a mast or tower to whaterevr your local max is and just put another antenna further down the mast below the 20 foot limit and use an antenna switch or manually unplug and replug as needed.

I recently saw an interesting antenna on eBay. Its a J-pole made from some flexible material. The builder claims you can just hoist it up a tree and its darn near invisible. I might try it out.

Subject: [GMRS] Hello from Tampa, Florida

Hi Everyone.
Just joining the group as a new GMRS licensee, WQFE480.

I've used GMRS/FRS continuously since the mid 90's starting out with the Motorola Talkabout 10 Channel, 2-Watt handhelds. (I bought 4 of those for 160 bucks each! Ouch!!) A number of my friends and I use GMRS for railfanning (Trainchasing) usually operating on Channel 4, 462.6375Mhz.

Now I've upgraded to Motorola CP-200's and am now testing the new BPR-40. Both are fabulous units. I realized I should license myself since I'm getting into bigger power.

I'm now shopping for a base unit, but before I buy anything I want to find out what the maximum ERP output is for GMRS fixed stations. The rules I've read say 5 watts, but I've also read posts from people who are running 25 and 30 watts.
Also, am I limited to a 20-foot antenna height? That's probably all I'll go anyway in consideration of my neighbors, but I would like to know the max anyway.

So, greetings from F-L-A. I'm looking forward to the information from this group.

Regards,
Danny Harmon
Tampa

Hello all,

Am getting back into GMRS, last time was 1995, anyway, anyone have suggestions for a base antenna, I was thinking of going with the usual groundplane or perhaps a J pole mounted on the chimney. Anyone have good experiences with a particular base antenna?

Also, anyone know of a GMRS repeater that can be used for non-emergency traffic in the Central New Jersey area? I have checked on the 'Net but I am sure there are more out there.

Thanks a lot for reading.

Mario, KAF5755

Hi Mario,

Sorry for the late reply. Out here in California, we've had an Electrical Stage 2 Alert, and several blackouts. So our power has been out for the past few days.

For many mobile antennas on GMRS, eBay is one of the ways to go. That's where I bought mine. Also you could try www.rkleef.com as he is a great guy and a reliable source to go by.

It's getting hotter here (over 100+) so I have to make it short today...

Thanks for the info Ryan. Yes, ebay is definitely the way to go.
Now it's just what to decide on. Also, FYI, there is a company
called Lakeview antennas that make all kinds of different mounts,
license plate mounts, trailer hitch mounts. They have plenty to
choose from.

Sorry to hear about you blackouts, hope all changes for the better.

Sincerely,

Mario

11676. Cordless phone on 462.625?

Yahoo group: GMRS (2005 — 2007)
Date: 2006-07-26 19:39:23 UTC
From: beateatit
Topic: 11676 Message: 11676

Heard a continuous carrier, two voices, one stronger than the other, and at the end of the conversation, a data burst and carrier drop.

Is this a harmonic or image, or is there really a cordless phone out there that uses GMRS freqs?

Was the conversation full duplex? If not it could be someone using a phone patch (illegally as I understand).

A few years ago there were many 'for export only' high power wireless phones on the market that used 400 MHz channels. Of course they were totally against FCC rules, and they should have never been installed in the US, but you know how that goes.

Just to rule out anything local, how wide of an area do you hear it in? If you lose it a block away, then you might have a spur or harmonic of something legal. Otherwise, it's an illegal high power wireless phone.

Topic: 11676 Message: 11680

Was it definitely a telephone type conversation?

I've got a couple of radios that when set to receive GMRS frequencies will pick up a fast-food drive through system on a distant frequency quite clearly.

I occasionally very clearly hear what sounds like cordless phones when my scanner is programmed to an 800 mhz frequency licensed to my state. They are very low power but come in very clear when I'm nearby. I've speculated it may be one of those wireless phone jack thingies but I've never researched it to see if it's possible.

11681. Using LMR UHF for GMRS

Yahoo group: GMRS (2005 — 2007)
Date: 2006-07-28 05:39:23 UTC
From: Steve Smythe
Topic: 11681 Message: 11681

So help me out here. If you're serious about GMRS, and you want mobile and base capabilities, can you use LMR UHF equipment?

I've been looking around, and seen that Motorola, Kenwood, and ICOM all have UHF radios in the 450-490 MHz range. Is it really that simple to get these mobile rigs, program them with GMRS frequencies, and away you go?

I really haven't found good pages that talk about mobile and base units. I've seen folks like the Kenwood 3140 UHF portable for daily carry radios.

Out here in Reno, we don't have any GMRS repeaters, and I'm looking into what it's going to take to get some neighborhood FRS and GMRS infrastructure together. I'm also a licensed HAM, and am working on developing a local CERT program in my neighborhood.

Thoughts? Experiences with this kind of work with GMRS? Links to sites with this information?

Thanks for your assistance,

Steve Smythe

Well, I own a repeater coordination network. It's been sucessful so far. I also own a repeater system as well as three commercial GMRS HT's and a mobile radio. All have served me well. You might want to try a search on Google for your query and plan to spend a few hours on the web. That's the only way to learn about this kind of stuff. There's also the gmrsrepeater group on Yahoo for more info on repeater systems.

If you ever need anything or have any questions, please feel free to ask myself or the group. We're always here to help.

11686. Programming of GMRS radios

Yahoo group: GMRS (2005 — 2007)
Date: 2006-07-31 17:11:10 UTC
From: m51f08
Topic: 11686 Message: 11686

Hello all,

I have been out of GMRS for about a decade, and back then used Motorola radios that had to be programmed by the dealer. Initially it was free, but then it was $25 per radio to reprogram.

Now I am getting back into GMRS and notice that some of the radios are owner programmable, using a PC. Has anyone done this, and what was required besides a cable and the programming software?

Thanks.

Mario, KAF5755

Really depends on WHICH LMR radios you're going to use.
Some have reasonable software costs, and some [like /\/\] charge all
outdoors for theirs.

You were lucky to have had your radios programmed for free. You must
have bought the radio(s) from the dealer, or you were otherwise a
good customer.

What radios are you looking at, and what part of the country are you
in? There are some on this [and radio programming] list(s) that
might be willing to help a guy out.

This is a little old, but I found this thread while surfing for something else. This link might be useful. A Amatuer radio operator wrote a little Simplex repeater program (freeware, check it out) Gabriel RIVAT, F6DQM has a website with a number of interetsting programs including this one.

http://rivat.chez-alice.fr/software.htm

Download simplex.exe. I have it but have not actually hooked it up yet. You are supposed to be able to use VOX mode but you can set the PC up as a simplex (store and forward) repeater using any radio you can wire up.

Interesting

From: Danny Harmon
Topic: 11691 Message: 11691

I have already asked part of this question, and been answered. But what's the benefit of incurring the expense of putting up a repeater other than as a public service ?
I know there are groups who want to create "REACT" style networks, but beyond that , for those of us who just want to communicate with people in our group, what the value of a repeater?

Thanks,

Danny Harmon

Hi Danny,

One of the main advantages of a repeater is that it increases the distance you can communicate compared to simplex, which has limited range. The repeater antenna is usually located at a much higner elevation, and retransmits at a higher power. Also, a handheld with a watt or so may be able to access the repeater and result in much greater communication distance.

Just my take on this, hope it helps.

Mario

From: Walters
Topic: 11691 Message: 11694

Hi Danny,

I am also new at this and the learning curve can be pretty steep. If you have power and proximity, then you probably don't care about a repeater. What I mean is, if your group is within direct contact range by virtue of the fact that you are either physically close enough and/or everyone has more than enough power to go the distnace, you are right, why add a repeater.

Here is a link to a true but funny story of one person building a GMRS system.

http://www.gmrsweb.com/gmrsrpt071800.html

I live in southern PA. The geography is rolling hills, very lush, lots of wooded area. The other people I want to talk to are at least 20 miles away as the crow flys and there are these ever rolling hills between us. With a 5 watt HT and a hi-gain yagi we can get about 10 miles in some directions (wheer no hills obstruct) but less if we run into a hill. SO, I want to (but haven't yet, $$$ as you know) put a repeater in my system (or better yet signup or get permission to use someone elses) as close to the highest point in my terrain. The repeater will create a "cell" of coverage if you will which will extend to all line of sight points with in area. Then my range can expand to 20 miles, 10 to the repeater and 10 more away from the repeater.

I am sure that some others who opertae repeaters can speak to their speific uses. It is true that you are not allowed to "make" money but groups of people can "share" the cost of running a repeater as loing as know one is "profitting" by it according to FCC rules for GMRS. I don't know everyone's names and call signs yet but I know that the gentleman who runs/coordinates/owns Bay Area Repeater ? in San Fransico is on this group. He would be one who can speak on actual experience and the whys and why nots of repeater use.

Danny, there are probably several answers to your question, but I think the most basic answer would be this one; to achieve wide area hand-held to hand-held coverage.

If your happy with your existing "communications foot print" utilizing the equipment that you currently have, then perhaps a repeater is not in your "list of needs", but if you need more coverage then a repeater may help you achieve that goal.

Hi Danny,

It's not like you have to put one up or are forced to do so... Especially if you don't have the resources, funds, and place to put one up in the first place. But since you asked, I'm going to rattle off a list of what a repeater is good for besides using it with REACT teams...

- Distance
- Knowledge of building a system
- Learning more about communication needs
- Meeting new people
- Helping and/or assisting others in times of need
- Filling in gaps where cellphones can't reach or can't be used
- Being sucessful in the GMRS community
- Enjoyment of owning a system
- Watching your ego expand...
- Have something in common with other repeater owners
- Because you can!

Don't know what else to say. There's plenty more I could say to you on why you should have one, or belong to a group who uses one, but if it's not right for you, then don't pursue it and don't worry about it. If you want more out of radio communication than what GMRS offers, then I suggest to go out and get your ARS license. They offer day classes that guarantee you to pass the same day along with your new license. Then you can explore the world of radio beyond UHF and 50 watts.

Also, no real incurring expense, unless you consider the land/building that your repeater is on an expense (rental, lease, etc). If you manage your system correctly, in time it will pay out even. Ready built systems are expensive. But as I mentioned above, if you put some learning and time into it, the overall process and equipment is really cheap.

There's a purpose for everything. You just have to find yours.

>repeater other than as a public service ?

In general, the benefit of a repeater is that it extends the range of mobile stations.

Let's say you are in your mobile, talking on a 35 watt mobile radio using a 5dB gain antenna mounted on your vehicle. Let's further say that I am using a 5 watt handheld with its rubber duck antenna. Neither of us is very far off the ground. The distance over which we can talk using simplex communications is limited primarily by the height of our antennas.

Now, let's say we use a repeater instead. This repeater has an antenna that's mounted at 200 feet on a tower somewhere between us. Because either of us only has to get our signal to the repeater, the height of the repeater's antenna becomes a greater factor. If both you and the repeater were the same distance from me, the repeater would hear me over a much greater range, because of its high-mounted antenna, than you would. And the same is true for you...you only have to get your signal to the repeater, not to me.

As for the expense, that's a big concern for the repeater owner. He has to pay for space on the tower and electricity to run the repeater in addition to purchasing and maintaining the repeater equipment. Some repeater operators try to recoup their expenses by charging a user's fee to access the repeater. Some repeaters are owned by clubs and the club dues go to repeater expenses.

Hopefully, this answers your questions.

Just because telephone interconnects aren't legal on GMRS doesn't mean that they don't happen.

A downtown Cleveland hotel operates an unlicensed repeater on 462.650 MHz. This repeater has an equally unauthorized telephone interconnect that is used for both incoming and outgoing calls.

There are 3 things you need for a successful repeater... Height, Height and Height.... The Higher the repeater antenna is, the better the coverage.... Here is a little story...

Back in the late 90's, i had the opportunity to put a repeater up on a 62 story building in NYC... The repeater was a old Kenwood desktop repeater with 15 watts out of the duplexer... We put a 10db gain antenna on the roof and ran 30' of 9913 cable... I was talking clearly on a portable from 60 miles to the east to a person in New Jersey 50 miles west of NYC....

So that makes the coverage approximately 120 mile radius of NYC.. and that's with just 15 watts...

so when the lights go out, and the cell service drains down to nothing, you still have something to talk to Da Wife or Da kids or friends and neighbors....

This is an excellent answer, Ryan. It touches on many points I hadn't thought of. However, my primary purose for using GMRS is ulilitarian. I want easy communication between me and my group when we're on outings.
I've thought about getting a ham license, but it really wouldn't suit my needs, where GMRS does, especially with the higher power available to licensed stations.

Thanks again,
Danny Harmon

Thanks to all who replied to my question.
I think Ty's answer hits it right on the head. I really have no use for a repeater network because my communications needs are mostly between my base and mobile, or close-proximity HT's.
I've cranked up my GM300's to 25 watts and so far, so good.

Thanks again,
Danny Harmon

Danny,

No where in the FCC Part 95 rules does it say that you cannot operate a handheld radio on 50 watts (maximum wattage). So why not skip the repeater, buy a couple of commercial LMRS HT's and increase the wattage. Or buy a couple of LMRS mobiles, increase the wattage, and use gain antenna's. Or use your current HT's (assuming you don't have bubblepacks) and add high gain mobile antennas onto them. Also works great and adds extra miles to them. (example: 4w + 6dB gain antenna = over 6 miles...simplex)

It seems to me that you don't have the funds and resources to buy a repeater system, or even to carry around one... Ever thought of building an inexpensive portable repeater system? Very simple to do. And can be under $100!

There are alot of ideas and resources that you can use to achieve what you want. You just need to know what to look for and how to use them.

If you ever need any help or have any questions, please don't hesitate to ask me. I'm always ready to lend a hand. And if you're local, I'll be happy to drive over to assist.

It's actually not showing any signal bars on the radio and flutters away even though my antenna is fixed and at ground level. The more times I hear it, the more I recognize the voice as one of the people that live in this complex. Which makes the legal/ethical issues of listening to cordless phone interference that much worse.

What do you hear as far as them controlling it? DTMF or some other non-voice tones?

Yeah, but I operate autopatches and none have operated without DTMF control (which this recurring interference has never included).

Just a quick point of order: you mention in a following post "cranking up (to)..25W." Depending upon the band, etc. ham radio licensees can use up to 1500W of power, though I dare say most find that overkill.

A thought that maybe we could include all of the messages together next time...

As for the phone issue, many old and new cordless phones have a way of changing their internal frequency so that it doesn't intrefere with another phone system (or in this case, a radio system). Sometimes, even though they may not be on the frequency that you hear, signals can run astray and cause interferrence with other receivers (note Part 15 labels on all electrical devices...). So maybe alert the neighbor of this issue and ask him to change the frequency of his phoneset. And because you are voluntarily not letting him know about this issue and still listening in on their private conversations, it then becomes illegal and a matter between parties of yourself and those on the other end of the line as well.

And as for the hotel using a "GMRS repeater frequency" with phone patch... recall back when licenses used to be grandfathered and businesses had the right to use these frequencies without always using their callsign. However, the phone patch is illegal and a radio shop (as some do) probably set them up saying that it was okay to do this. The hotel (let's assume...) probably doesn't know right from wrong when it comes down to this. Since those of you who are licensed for GMRS (physically hold a license), live near that hotel, and can maturally discuss this issue with the manager or owner, the problem(s) can become quickly resolved. They can move to a business band, or if they do in fact still have their grandfathered license, then immediately stop the use of phoe patch on the frequency. Also let them know that they can use phone patch on business bands as well, and that the equipment is readily available through an authorized dealer.

I've worked with several groups here in the area that have notified hotels of their use with radios on GMRS frequencies. And most of the times they are illegally set up by small radio shops that just need the money and business. They've also shut down the hotel's radio systems and reopened them onto other bands that don't affect GMRS, ARS, or other bands not intended for business use.

I've talked on a hotel repeater once, and startled the maid service. They asked me to get off their frequency, but because I had a license and they didn't (??-according to the maid) I had the right to be on there. However, because I also have respect for others businesses and property, I notified my partners and quickly resolved that issue.

As long as you have a positive attitude, are responsible with your actions, and know how to handle the problem correctly, any situation can be resolved.

The phrase is "grandfathered licensee" and it means a business that was licensed prior to the rules changes made to GMRS that no longer allowed new licenses to be issued to business entities. Existing licensees were not allowed to make changes to their existing licenses (i.e. change frequencies, add more radios than they were licensed for originally). They were, however, allowed to keep renewing their existing GMRS licenses.

11718. Multiplexers on Repeater Sttions

Yahoo group: GMRS (2005 — 2007)
Date: 2006-08-10 11:56:28 UTC
From: Danny Harmon
Topic: 11718 Message: 11718

I'm looking on ebay at repeaters and find a lot of multiplexers for sale.
I gather that a multiplexer allows a repeater to operate with a single antenna versus one antenna for transmit and one for receive.
Does a multiplexer usually work well or does it introduce a compromise in performance? If it works well enough it sounds like a multiplexer is the way to go.

As always, thanks for the great info.

It's usually called a duplexer. Yes there is a small signal loss in both transmit and receive. But on the other hand, the two antenna solution has its own problems, the receiver densense you get from coupling of the transmit signal back into the receiver can be worse than any loss from a duplexer. They solve more problems than they cause, hence they are popular. As usual not all antennas, coax, duplexers are created equal... You can lose more signal in cheap coax than in a duplexer.

In the two way world, a multiplexer takes one
antenna into multiple radios for RECIEVE.

A duplexer allows the repeater to use one
antenna.

duplixer is used to have a repeater on one antenna. multiplexer is to have
a number of TX on one antenna but not receive. another name would be a
combined.

A term that means a license that's been transfered from an older radio service of the same band to the new service. GMRS today used to be Citizens Band Class A Service, and required a license. The CB radios (23 and 40 ch versions) you see in trucking rigs were originally only 23 channels and called the Citizens Band Class D Service. It too required a license at one time, but obviously is no longer required (no do those licenses exist in the database). My friend still has his Class B license from back when: KPBZ2117...

This is what we're afriad could happen to GMRS as well... More on this at:

From: kvsp1160@aol.com
Topic: 11723 Message: 11723

I couldn't care less if the business (of any kind) was on any GMRS frequency, as long as they have a license that is current; a grandfathered license that may cover the entire business, or indivual licenses for all employees that operate the radio equipment (how many there may be).

What I care is the fact that a business or individual is using any GMRS frequency without a license, and/or is violating Part 95-Subpart A in any way or form. This includes 95.127 and 95.141 which refers to linking and autopatch.

There are also other area that I/we/others have to cover and make sure it doesn't happen, such as TPO wattage, interferring with REACT or other emergency communication systems (simplex or duplex), illegal operations of equipment between services, etc.

If we didn't care and allowed this to happen, then GMRS would become another Citizens Band service where the FCC doesn't really monitor or care what goes on with the associated equipment, language, users, etc.

So it takes individuals and organizations like mine to handle these types of problems and resolve them as quickly and quietly as possible. General Mobile Radio Service should be a place where individuals and families can come to communicate with each other as well as have a place to learn about the world of radio communications. A place where we can provide the community with emergency and non-emergency services and communications in times of need. Without rules and regulations, restrictions and guidance, you can forget about those nice repeater systems and start using bubblepack radios again... Kinda hurts thinking about it, huh?

Topic: 11724 Message: 11724

Multiplexer is a new one for me... but since you described it, I think the term you mean would be "duplexer". I believe there's a difference, but not exactly sure on that one...

Yes, a duplexer is what you need to operate a repeater, and is much better than using two antennas, as they sometimes tend to cancel out each other if too close. A duplexer consists of an even amount of cells or tuning rods that allow you to tune the frequency of the input and the output of the repeater and then combines the signals together to the antenna... Kinda lost you huh? Me too.

Let's say your repeater is receiving (RX) on 467.675, and it transmits (TX) on 462.675. You just bought a 6-cell duplexer (remember even cells...). You'll want to tune the first three cells to your RX which is 467.675, and the last three cells to your TX which is 462.675. You then connect the repeater's TX to the TX on the duplexer, and the repeater's RX to the RX on the duplexer. Now the third jack connects to your antenna. Setup is done... But how does it work?

When the repeater receives a signal, only the 467.675 frequency is allowed to come through the duplexer to the repeater. And then when it transmits, only the 462.675 frequency is allowed to exit through the duplexer. The antenna acts as both the TX and RX antenna and the duplexer combines the signal to eliminate the two antennas.

Without a duplexer and using two antennas, if the antennas are close together or are not seperated apart far enough, then they could interferre with each other or cancel out their signals.

Also, the reason for using an even amount of cells, is so that you can divide the duplexer in half equally to tune it to the frequencies...

...Explaining wasn't my greatest strength, so if you're still confused, maybe another's explanation will make better sense...

Ah, no.

There is no requirement that a duplexer have an equal number
of "cavities" (Cells??????) or "cans".

It is pretty common, but it is not anything that is required.

Hi,

Yes, Class D CB is now an unlicensed, unmonitored service. Sunspot cycle seems to cleanse it periodically. Old licenses are not in the database but the current rules state the you may use your old license as your "handle" if you wish to. The cost of the old Class D licenses came down over time until it stopped altogether. I paid $40 to become KIS5155. An organization in Australia known as CREST is basically the equivalent of REACT here. They use what they call CB quite extensively even today. I don't know how closely it resembles our 4W 40 channel band.

I know the debate rages here about the bubble-pack combos. Without monitoring by GMRS licensees and education the only thing standing between GMRS and the fate of CB is the $80 license fee. I think the manufactures need to be forced to improve the emphasis for licensing on the packaging, its pathetic. We were looking at a combo radio manual at our REACT meeting the other night and you had to get all the way through the operating section and into the legal mumbo jumbo at the end before the word license appeared. No body reads the book, and if they do they most certainly don't look at the legal stuff, very bad.

This course of action would put my residence here at risk - good deeds do not go unpunished. I cannot risk direct contact about this issue, as it would bring my low radio profile way out in the open. I will change/lockout the freq whenever it comes active with the cordless phone.

Possibly someday I will be able to send an anonymous letter printed on a different printer letting the person know.

I think that GMRS will likely not go the way of CB for two reasons:
First, it's UHF-FM which doesn't propagate the way 27MHz AM CB does.
No real range without serious, costlier power. The bubble packs
aren't really much of a threat because they have no real power or
range.
Second, is the availability of PL Tones. CB never had this (Did it?)
Makes a giant world of difference if you don't have to listen to all
those yahoos while monitoring a channel for your own people. And, at
least in my area, the sheer number of available PL codes seems to
keep things fairly well separated.

The only real threat I can see is if Uniden or Midland starts making
cheap, 25-watt GMRS base or mobiles and WalMart starts selling them.
Then we're in trouble.

Regards,
Danny Harmon

With a duplexer you normaly have one(1) reciever and one(1) transmitter working off of one(1) antanna.

With a multiplexer you can have a number recievors or transmitters working off of one antanna. I know one setup that has, if I remember correctly, 6 transmitters on the same antanna.

Danny Harmon <distsig@...> wrote:
I'm looking on ebay at repeaters and find a lot of multiplexers for sale.
I gather that a multiplexer allows a repeater to operate with a single antenna versus one antenna for transmit and one for receive.
Does a multiplexer usually work well or does it introduce a compromise in performance? If it works well enough it sounds like a multiplexer is the way to go.

As always, thanks for the great info.

I don't want to go off topic, so this is the last string from my end on CB for now...

Australian CB is pretty much the same as us, except they allow a higher wattage and I believe they are on the UHF band. I know that there were a few curious people out there, so I wanted to clarify that. At one point I knew everything there was about the history of CB, until I found GMRS, then totally forgot about CB... until our local group used it, then I got plugged back in... Don't ask why, but so far I've helped alot of people on the road while on the road. And frankly, it's fun... You meet everyone out there when on the highways, and you got 40 channels to use in both AM and SSB!

Enough of that... Back to GMRS -- 73!

Well, technically you could rig your antenna to bounce off others to achieve that, but it can be hard. And we do have repeaters to handle...

Although it may not have the same characteristics as the CB Class D, it's still the Citizens Band Class A-General Mobile Radio Service. And therfore can go back to a CB service if the FCC chooses, but without the license.

I (and plenty of others) thought that it should have been smart for the FCC (ha, there's a thought) to make the FRS/GMRS freqs non-licensed and have a high power wattage of 4 watts like CB, but still have the same features as they do now. And for GMRS's 8 simplex and 8 duplex freqs, keep the license. That way you can have bubblepack radios with the original FRS freqs on 1w and the GMRS shared freqs (ch's 1-7) at up to 4w; but keep the 462.550-725 freqs off of the bubblepacks.

A lot more sense and less hassle for the rest of us who actually own repeater systems or do business (emergency, coordination, etc) on GMRS.

But hey, do they ever listen?!? Nope.

Hi Danny,

You have good points. You are right, CB has no PL capability. When you monitor you here the total amalgamation of every transmission out there and the the stronger signals are the ones you hear above the background noise. Under normal circumstances you just squelch out everything in the wash and don't worry about it. But as a REACT monitor, the idea is to try to intentionally dig out some weak plea for help. That means unsquelched listening for a chunk of time as long as you can stand it, LOL.

I have yet to do any range comparisons between CB and GMRS. I have my CB mobile and I am working on getting my GMRS mobile antenna now. Then I will start working on getting my bases setup. Once I do I'll conduct some drive around testing. I monitor CB 9+19, GMRS .675 and FRS 1 when I am mobile. I here FRS 1 activity occassionally either as I pass them off the road or car to car. Without an external antenna they have very little range. However, I suspect that 2 GMRS units with external antennas might do as well as CB, especially with all the wash on CB.

As long as the FCC doesn't just decide to pack it in and give up. However, for now I think they are happy to get every $80 fee they can. If someone buys a bubblepack and (by some miracle) finds the license info AND actually does it, its frosting on the cake.

First, it's UHF-FM which doesn't propagate the way 27MHz AM CB does.
No real range without serious, costlier power. The bubble packs
aren't really much of a threat because they have no real power or
range.
Second, is the availability of PL Tones. CB never had this (Did it?)
Makes a giant world of difference if you don't have to listen to all
those yahoos while monitoring a channel for your own people. And, at
least in my area, the sheer number of available PL codes seems to
keep things fairly well separated.

The only real threat I can see is if Uniden or Midland starts making cheap, 25-watt GMRS base or mobiles and WalMart starts selling them. Then we're in trouble.

Old licenses are not in the database but the current rules state the you may use your old license as your "handle" if you wish to. The cost of the old Class D licenses came down over time until it stopped altogether. I paid $40 to become KIS5155. An organization in Australia known as CREST is basically the equivalent of REACT here. They use what they call CB quite extensively even today. I don't know how closely it resembles our 4W 40 channel band.
>
> I know the debate rages here about the bubble-pack combos. Without monitoring by GMRS licensees and education the only thing standing between GMRS and the fate of CB is the $80 license fee. I think the manufactures need to be forced to improve the emphasis for licensing on the packaging, its pathetic. We were looking at a combo radio manual at our REACT meeting the other night and you had to get all the way through the operating section and into the legal mumbo jumbo at the end before the word license appeared. No body reads the book, and if they do they most certainly don't look at the legal stuff, very bad.

Wow, and I spent all that money for a license, good base/mobile antenna system and 25 watt radios, while all I needed to do was pick up a pair of those blister-packed handie talkies!!

Just kiddin! Yes, they do make some interesting claims on their advertising. What's even more amusing is that in the instructions some of the manufacturers actually say not to transmit on certain channels without a license. Hopefully, users will abide by those admonishments.

If these are the Motorola, Midland, Cobra or the new Insignia Products brand, then I believe it. I was just at Best Buy the other day, and compared all of the radio packs. It seems like they do claim the 18 miles ONLY if you are in optimum operating conditions. This includes the desert as explained on the back on the packaging (but in very small print). And every package (except the Insignia Products brand) says that an FCC license is required on the back on the packaging. As for theat other off-brand, they say that "GMRS licensing will be required", but nothing about the FCC, etc.

A few of the 5 mile GMRS/FRS packs did not however have the license requirement anywhere on the packaging, but still was over the 1w limit -- actually they claimed a "Huge 4 watts on both FRS and GMRS" which violates Part 95, and is also lying to the consumer becuase the FRS cannot put out more than 1 watt.

Anyone else find these in your local store? Spend a good time looking and get rid of the sales employee cuz they are never helpful...

FRS limit is 500mW or .5W. If the FRS channels in the 467.XXX range are not hardwired for .5W its getting even worse.

11747. GMRS Repeaters in the Austin Texas area

Yahoo group: GMRS (2005 — 2007)
Date: 2006-08-16 13:32:30 UTC
From: bill57pitts
Topic: 11747 Message: 11747

The online resources for GMRS repeaters located in the Austin, Texas area are either woefully outdated, non-existent, or I'm way off on my searches.

Anyone know of an online registery of GMRS repeaters as described above?

OR, anyone know of a group for GMRS repeaters (family oriented, not REACT) in this area?

11748. Re: Multiplexers on Repeater Stations - Misunderstanding...

Topic: 11748 Message: 11748

Greetings everyone,

I received a private email from a person on this group who made a comment on my explanation of a duplexer. It seems that I made a mistake when describing how to tune a duplexer and what the parts are called. I originally said, and I will quote "A duplexer consists of an even amount of cells or tuning rods that allow you to tune the frequency..." The misinformed word I used was cells. The correct word should have been cans, although I did also describe them as the tuning rods.

I also explained that, and I will quote "the reason for using an even amount of cells, is so that you can divide the duplexer in half equally to tune it to the frequencies..." This also is somewhat true, but is not required per Part 95 for GMRS or by any other radio service under the FCC. It is helpful to evenly divide the duplexer in half, but you don't need to have the same number of cans or tuning rods per frequency.

I'm sure that there are other descriptive words to explain the parts of a duplexer, and also a more technical and correct way of explaining how a duplexer works, which are used throughout the radio communication industry, but as I also explained in the original post, I am not good at describing on paper. But more in person with hands on visuals. Hey, I'm almost human...

So I apoligize to the entire group for the misinformation, and will be happy to answer any questions anyone may have on this topic, or any other topics as well.

We're still learning whether we like it or not... Have a great week and 73!

As long as the makers keep the construction guidelines, (one piece antenna, etc) I don't think there's too much threat from the bubblepacks. I don't care what claims those guys make, I've never seen one that do more than half a mile in Florida.
Now you guys out on the prarie in Nebraska may have more interference from a neighbor 5 miles distant, but in wooded or urban areas, the FRS radios just don't seem to have any worthwhile distance.

Nope. But with a full 4 watts on two HT's with good audio and good components, etc, those signals will penetrate through a couple miles of wooded hills with no problem... on GMRS of course.

Proven by myself and my friend while camping in the California Redwoods, with a pair of PR-460's. And our pair of Motorola T6400's went about a little over a mile in the same general area before the PR-460's. Still have the T6400's as a cheap backup...

The UHF "CB" band in Australia and New Zealand consists of 40 channels with a five watt limit in the area of 477 MHz. Eight of thes channels are paired for repeater use. Similar to GMRS in the United States, a license is required.

Hey, that's great to know. I was reading about a REACT equivalent down under called CREST. They use CBs (which now we know is more like our GMRS, hence the tie in) much the same way that REACT teams state side operate, most of them have moved to GMRS for event and field ops.

Very cool to know.

Thanks

11755. Business Radio Licensing

Yahoo group: GMRS (2005 — 2007)
Date: 2006-08-18 04:42:02 UTC
From: kvsp1160@aol.com
Topic: 11755 Message: 11755

I just became aware of a business called "Business Radio Licensing" that sends letters out to those whose licenses need renewing, etc. They offer services to help you do that, but they also tack on extra $$ to make a profit as well. If you choose to cancel the process with them, they will charge you a minimum of $35.00 as a cancellation fee.

If anyone has received this letter in the US postal mail, I suggest to shred it and do it yourself online for free. It will still cost you the $80 for the renewal, but the FCC doesn't add more costs to renew your license and if you cancel, then you loose your license.

The negative part about this is for the new people who are not familier with how the FCC operates, may think that this company is a part of the FCC and is required to send in their information to them. The letter looks official, except for the fine print at the very bottom that states: "Not Affiliated with US Government Agencies."

Thought everyone should be aware of this. And yes, the company is legal, because your license is available as a public record on the FCC website... Although I don't agree with this business' operations.

Ah, something we can agree on.

Business Radio Licensing is one of a couple
of companies that do this, and their methods are...
questionable, but legal. They have been around for
many years, so there must be a lot of people that
fall for it.

People do need to just tear that letter up, but be
sure to renew yourself!

Yahoo group: GMRS (2005 — 2007)
Date: 2006-08-18 20:27:57 UTC
From: Mr. Ed
Topic: 11755 Message: 11760

I got a similar letter when my license was up for renewal. As I remember it implied I should renew through them and stated something about the complexity of renewing directly with the FCC. It went right in the shredder.

I wonder if they mail their stuff to others like hams or businesses or if they just target GMRS users?

Mr. Ed

I received the same letter two days ago. I don't want to start a chain on this but suspect they do a blast junk-mailing to all GMRS license holders and hope to get a certain percent of folks who pony up the $$.

I got a similar letter when my license was up for renewal. As I remember it implied I should renew through them and stated something about the complexity of renewing directly with the FCC. It went right in the shredder.

I wonder if they mail their stuff to others like hams or businesses or if they just target GMRS users?

Yes, I receive similar "official" looking letters in regards to commercial licenses I'm responsible for as well.

It was news to me that they have expanded into the GMRS licenses.

They offer a service that may be intimidating to some people, that's fine, but to make it appear that it is an official communication and mislead one into thinking that is the FCC is wrong.

They (and other company's like them) target any & everybody that has an
FCC license that is within about 12 months of renewal. They even send
those letters to expired license holders, hoping to get the expired
license holder confused and scared enough to send them the $$ and get
"legal"!

I got my first GMRS license in 1986, and seems to me they were around then.
We have always told the people in our group to "trash can it" when they receive the letter from them.

11769. Maxon 210 + 3 problem

Yahoo group: GMRS (2005 — 2007)
Date: 2006-08-22 13:03:03 UTC
From: m51f08
Topic: 10249 Message: 11769

Hello all,

Just got an old Maxon HT from the mid '90's. It turns on, but all the display digits,messages appear on the LCD and are frozen. Usually, it takes a second or two for the microprocessor to kick in, but this one stays in this "frozen screen" mode. Checked power supply, battery, all is fine.

I am in the process of trying to figure this one's problem, and upon opening the case, it seems like the circuits are mostly IC's. Very few of the more familiar resistors, caps, diodes, etc. Was wondering if anyone has had this problem, perhaps one of the IC's are kaput.

Would appreciate any help if anyone has encountered this problem, and thanks for reading.

Mario, KAF 5755

11770. Re: [GMRS] Maxon 210 + 3 problem

I had 2 of the old bricks myself and they spent more
time going back to the factory for that problem ,they
changed the IC's so many times under warranty I can't
remember ,they were great radios when they worked ,I
know the last time I called them they nad no more
parts to repair them.

11771. "the letter"

Yahoo group: GMRS (2005 — 2007)
Date: 2006-08-23 03:44:32 UTC
From: jeff daugherty
Topic: 11771 Message: 11771

Hello everyone, I know earlier some people were talking about getting a renewal letter from an "outside" company

Well I just got mine today.....

here is what was written in the letter.....

(my comments in brackets) and highlighted

Daugherty, Jeffrey A
Attn: FCC Contact
P.O. Box xxxx (did you really think you were going to get my address?)
Phoenix,AZ xxxxx-xxx

BUSINESS RADIO LICENSING
Renewals and Modifications
26941 Cabot Rd. #134 Laguna Hills,Ca 92653

Dear Licensee
Our review of the FCC records shown that you or your company (didn't they do away with business licensing in the 80's??)
was granted an FCC License under call sign WPTT519 (well at least they got the call sign right!!)
which will expire. Your License was granted five years ago (duh) and now must be updated to continue operation of your radio system
(cool I didn't know I had a radio "system")
If you do not update renew or modify your existing FCC license it will expire along with your authorization to operate your two-way radio's

Your current FCC call sign WPTT519 will expire on 20061212 (don't you just love the way they write the date? makes you cross eyed!!)
If you still operate the two-way radios covered by the call sign that is shown, you will need to renew your license or you will loose your authorization to operate
Business radio licensing has been filing new licenses, modifications and simple renewal applications with the FCC for over 24 YEARS
(they have conned people for 24 years?? gee's what a record!!)
and we can file your renewal or modification for you. (how sweet) Failure to renew will cause your license to expire and the continued use of two-way radios without
a valid FCC authorization can cause the license holder to be fined as much as $8,000.000 per day for unlicensed/improperly licensed use of two-way radio system
(there they go with system again)

TO HAVE US PROCESS YOUR RENEWAL OR RENEWAL MODIFICATION APPLICATION SIMPLY FOLLOW THE INSTRUCTIONS BELOW
(this gets good!)

(A) Review License information contained below; Show any changes directly on form since last licensed.
(they have a poor copy of part of what you can pull up on ULS)
(B) indicate contact person and telephone number & fax number of person who is handling this application. (yea sure my fax number so I can get MORE junk mail from you!!!)
(C) enclose a processing fee of (get this) $95.00 (15 dollar profit guys/gals!! but it gets better they don't even mail the form for you!!! AND send you WRONG form!!)
(D) Once we receive your request (and money!!) we will process FCC form 601 (NOT FORM 605????) and RETURN TO YOU for your signature
Be sure to include a check and information sheet below when returning (yea don't forget the 15 extra bucks!!!!)
WE NOW ACCEPT MASTERCARD AND VISA call our office for details (wow how nice!!!! so does the FCC for no EXTRA CHARGE!!)

If you receive more then one of these letters from BUSINESS RADIO LICENSING each will refer to different call signs held by your company (there we go with company again!!) and should be handled separately concerning processing fee's (yea clean you out on all Licenses!!!!)
Due to the recent changes in the FCC rules & regulations your application will require ADDITIONAL FCC filing fees. (yea right invent extra "fee's" to clean people out)
WHEN WE RETURN YOUR APPLICATION WILL REQUIRE ADDITIONAL FCC FILING FEES (yea right you already are asking for 95 bucks the fee is 80 bucks.
now your saying you will require extra fee's?? and that is an fcc rule and regulation???? yea right)

(you will love this....a fee for letting your license expire!!!! yea right)

IF FOR ANY REASON YOU DECIDE TO CANCEL THE LICENSING PROCESS A MINIMUM THIRTY-FIVE DOLLAR CANCELLATION FEE WILL BE ASSESSED
(oh please just pick us up by our feet and shake the change out of our pockets!!!!)

Should you have any questions concerning your license or licensing requirements you can call our office between the hours of 8am and 3pm PDT Monday through Friday
(wow toll free number, thanks for the free call after cleaning out thousands of people for "over 24 years")
1-800-783-9006 or you can e-mail us at info@...

well people that is the letter!!!!!!!!!!!!!!!!!!!!!
IGNORE THIS LETTER IF YOU GET IT..
YOU CAN RENEW YOUR LIC ONLINE ON THE FCC WEBSITE FOR NO EXTRA CHARGE OTHER THEN THE 80 BUCKS.
ADDRESS CHANGES ETC. SAME PLACE. THESE GUYS ARE RIPPING YOU OFF... THEY MAIL YOU THE FORM AND HAVE YOU SIGN IT AND SEND IT INTO THE FCC..... notice it is form 601 NOT form 605... geeeeze

Jeff
WPTT519

Phoenix,AZ

Good evening Mario,
You may or may not remember me. I own a few of these
radios, and while my answer is of no help to you, I have personally
never seen this on any of my radios.
Have you tried the reset? Unless my memory is terribly
faulty, as it CAN BE sometimes, I thought I remembered something
about reset somewhere in the vicinity of the re-programming
directions in the book..... Could be wrong, but perhaps worth
looking?
Good luck, partner.
Ed

Subject: FS: GE Mastr II UHF Repeaters

3. GE MASTR II UHF REPEATER SYSTEM - Complete
Complete UHF Repeater System - Includes:
a) Duplexer (54-watts out)
b) GE Card Tray {Part # PL19D402486G1 Rev E}. Has GE card w/
CommsSpecialists PL dip-switch boards.
INSIDE SWING DOWN DOOR COMPARTMENT:
c) GE Card Tray {Part # PL19D417214G1 Rev D}. Cards include "Rptr
Control", "Audio" & "10 volt Regulator Control".
d) RX/TX Rack Mounted {Part # PL19D424895G32 Rev F}
e) Swing Open Tray {Part # PL19D417262G1 Rev _}
f) (Unknown brand) Power Supply on very bottom. The original GE
power supply died. We yanked that out and put in an unknown brand
item that was donated to us to us.
Repeater currently crystalled on public safety 453.925 Rptr (458.925
Input) PL 71.9 and operational. Repeater puts out 79-watts out from
duplexer @ antenna port (N-female).
Asking $899 each/bo. Now I CANNOT ship this due to weight and I have
no way to pallet this up to ship by trucking company - so have to be
PICK UP ONLY (Massachusetts).

** I do have digital camera pictures of every item listed here.

Info: E-mail me at: cmpsa1 at gmail.com

Thank you for your time,

The FCC forms were (actually still are) poorly designed for mere mortals to fill out. Most non-tech folks will stumble over things like lat/lon and radius of operations in km (most Americans do not understand metric anyway).

The on-line processing of new apps and renewals has made the process almost goof proof - at least your form won't be returned (even though the FCC keeps the fee) because you forgot to fill out or check dome obscure box.

If you are going to construct a complex system, then it does pay to have the radio supplier help you with the original app. A few hundred dollars is a very small percentage of the system cost - sort of like using an architect to plan an addition so the plans won't be bounced by the building inspector.

The radio supplier should also be expected to provide a modicum of guidance if you upgrade the system - after all, you will be buying more radios.

From: Ken
Topic: 11771 Message: 11775

Theres no reason to use any outside party to renew, on an initial application for a public safety pool license it does cost some extra $$$$, only because you have to pay a frequency coordinator to assign the frequencys used (as mandated by the FCC) BTDT. I've received letters trying to sell me a copy of the FCC rules because "you have to have a copy on hand" at a premium no less, I understand all you have to have is access to the appropriate sections and hey I have a computer that can access then right at my desk.

Just remember this quote "theres a sucker born every minute" P.T. Barnum!

Welcome Jeff,

I've seen the license arrive in your mailbox in as little as three (3) days. Usually a week is long enough.

Hi,

They issue the license within a couple of days. You can check the online database for your callsign before you get the paper. I paid on 6/21 and the print date on the license was the 22nd.

Usually it takes a few weeks for the FCC to issue your license. You should check licensees in your town on the FCC database at wireless.fcc.gov/uls periodically because they sometimes post your license on the website before you receive it in the mail.

Topic: 11789 Message: 11789

Sent: Tuesday, September 05, 2006 6:48 PM
Subject: Re: clean house days.

well the Kenwood and Icom we sell mostly are new or demo radio's as we are a Kenwood and Icom dealer.

The TK 380 is cost +10% that covers shipping so It is like a give away price. The TK-380 with keypad is below cost. I also have a TK280 I used it as a demo I would sell for 215.00 that is below cost just want to get it out of here.

Some of the give away Items have a number of Maxon 2800 series HT UHF with chargers new in the box old stock and rapid chargers for them. $50.00 radio, charger and antenna. Not sure it I have any batteries for them but Tessco does. Got one Maxon SL-70 UHF and charger $60.00 .

Have 6 (or more) EF Johnson 9841 mobiles 25 watt UHF new in box old stock $100.00 each will do both normal 2 way and LTR if needed.

Have a Ritron repeater 25 watt with duplixer and phone patch UHF 464.xxx set up at this time needs to be tuned of freg. but works. $200.00

Have a number of Micor UHF repeaters (some for parts and some working unit) all in 460 band some low power and some up to 75 watts.

Well there also is a lot other things I need to clean out. Have a number of Zetron 38 tone panels, duplexes UHF and one VHF (not ham) DB-412 450 to 470 and maybe a DB-420 450 to 470 (would have to look I know there is one in TN)

Have a number of Motorola P-100 HT 2 and channel UHF and maybe VHF $40.00 each chargers I would have to look. Some Maxon mobiles 25 watt 4 channel UHF $50.00 each.

Well that is some of my list let me know or make an offer. Thanks John

Gatekeeper... or whatever your name is... Assuming you have a license:

Definately stay away from the bubblepack radios that they sell in target and walmart stores. Not worth your money. Get a commercial-grade radio that can transmit on the GMRS only frequencies (462.550, 575, 600, 625, 650, 675, 700, 725) (467.550, etc if TX on a repeater only). They may cost anywhere from $40 to well over $300 for either a handheld or mobile radio. And yes, there are base radios that you can buy, but they are not made specifically for GMRS. You'll need to program or tune them.

How far can you talk? Depends on the location you're at. If you're in the city or on a mountain at 4,000 feet in elevation, using 4 watts or the full 50 watts. What type of radio are you using? What kind of antenna does it have? If you're in the city using a 4 watt HT (handheld), you'd get about 1-3 miles roughly. If you're in the city using the full 50 on a mobile with a good antenna, consider a greater range of at least 8+ miles. However if you're on that mountain with any power, you'll definately get out farther... guaranteed!

Don't know why you need a few people's messenger names when you can ask the entire group here of over 2,000 members. Now, not all 2,000 are going to reply, but a good many will help you out.

Anything you need or if you have a question that you're stuck on... all you have to do is ask.

73 (best wishes)!

The ICOM IC-F21GM appears to be a nice GMRS handheld. It has the GMRS freqs in it already, no PC programming required. You select what you want to store in memory and it is repeater capable. I think I saw them at AES for $149 but somewhere else for 120. I saw one on ebay for under 100.00 so I bought it and am waiting for it to arrive. It has variable power settings of 4,2 and 1 watt. I'll report my experience once I play with it.

thanks kvsp for info ! and i will use the group e-mail. my name is joe !

kvsp1160@... wrote: Gatekeeper... or whatever your name is... Assuming you have a license:

Definately stay away from the bubblepack radios that they sell in target and walmart stores. Not worth your money. Get a commercial-grade radio that can transmit on the GMRS only frequencies (462.550, 575, 600, 625, 650, 675, 700, 725) (467.550, etc if TX on a repeater only). They may cost anywhere from $40 to well over $300 for either a handheld or mobile radio. And yes, there are base radios that you can buy, but they are not made specifically for GMRS. You'll need to program or tune them.

How far can you talk? Depends on the location you're at. If you're in the city or on a mountain at 4,000 feet in elevation, using 4 watts or the full 50 watts. What type of radio are you using? What kind of antenna does it have? If you're in the city using a 4 watt HT (handheld), you'd get about 1-3 miles roughly. If you're in the city using the full 50 on a mobile with a good antenna, consider a greater range of at least 8+ miles. However if you're on that mountain with any power, you'll definately get out farther... guaranteed!

Don't know why you need a few people's messenger names when you can ask the entire group here of over 2,000 members. Now, not all 2,000 are going to reply, but a good many will help you out.

Anything you need or if you have a question that you're stuck on... all you have to do is ask.

73 (best wishes)!

11799. What is the Max transmitting power on GMRS

Yahoo group: GMRS (2005 — 2007)
Date: 2006-09-08 14:07:42 UTC
From: Vance
Topic: 11799 Message: 11799

I'm a bit confused. Looking at the regs 95.135 it says no radio may operate at more than 50w then it goes on to say a fixed station can operate with no more than 15w output. Can a repeater transmit at over 15w? If so where do I find that info? Thanks. WPXH772

11800. Re: [GMRS] What is the Max transmitting power on GMRS

From: Tom Parker
Topic: 11799 Message: 11800

Your repeater can transmit with up to, but not more than 50 watts Tx Power at the Transmitter ouput as can the mobiles. A small control staion can transmit with no more than 5 Watts Effective Radiated Power (ERP), and a designated (I forget the correct term) station can transmit with 15 watts Tx Power. It's is somewhat confusing on the first read... but the "fixed" or designated control station has to have it's coordinates registered and the "small control station" does not. It can operate from anywhere.

I don't have the rules in front of me, but if I am incorrect, I am sure someone will correct me.

Ya, welcome to the world of GMRS! ... But on a more serious side...

A fixed station is different than a repeater or base station, and most of these rules were transfered over from when this service was considered the Class A Citizens Band Service. (class D was and is our current CB...)

So yes, you may operate your repeater or mobile or handheld (why a HT though) up to 50 watts. And even though you'd think that a repeater system is a fixed system, it really isn't. But I won't get into that (unless someone wants to go into detail on the history...)

Sometimes it helps to think about why some rules are there.

A base station, or a repeater, transmits on the repeater output frequency. Range is critical. You don't know where the person picking you up is, so get out to the horizon in all directions with as much signal as is possible. Tall, omni, high gain antennas are best.

The fixed control station is on the repeater input, transmitting to only the repeater. Neither should be moving, so a directional antenna is best. No power is wasted in other directions. You should have just enough power to be heard clearly by the repeater receiver. No more. Why? Overshoot. You don't want to get into, or desense, other repeaters. If you put 50 watts, on a repeater input frequency, into a tall antenna, you could be keying up repeaters for hundreds of miles. Even if the PL is different, you'll have a stronger signal on their repeater receiver than their user on a weak handheld. Neither one of you will get repeated by the distant repeater.

So, in general, when you transmit on:
Repeater output frequency: High, omni, high gain, 50 watts.
Repeater input frequency, just above the building, very directional, just enough power, but not more than the rules allow.

11803. Radio Repair

Yahoo group: GMRS (2005 — 2007)
Date: 2006-09-09 14:04:01 UTC
From: Walters
Topic: 11803 Message: 11803

OK, I bought an old Wilson WU1510. It is user programable (as long as you are not afraid to open the case and short out a couple of contacts) and that worked fine. I can program to my heart's content. Tested the programing, fine. However, about 2 minutes after power on, transmit dies. If you are transmitting, it just flutters away. And you don't have to transmit at all, it just goes away after the 2 minutes whether you transmit or not. Shut down and leave the unit off for 2-3 minutes and you can transmit again for a couple of minutes. The receive side seems to continue to function. Sounds like a thermal problem.

So, my question is, where do you take your radios for repair. I am not adverse to sending it away. I live in Shrewsbury PA, half way between Baltimore MD and York PA.

Thanks in advance for your reponses.

Walter,

It could just be alignment. If you have a dummy load, program other freqs in it and see if it is stable lower in freq. These radios did not spread very far. But and there always is a but! I used to work on those and was factory trained. If you can call a 2day class at a hotel going through the service manual training. Anyway it was a very low cost radio and by that I mean it was engineered as low cost as it could to do the job. Now to their defense it was a very popular radio due to it being field programmable with no extra equipment.

At the cost of bench time today. I would stick it in the closet and find another. Unless you can find someone close that you could get to look at it for the cost of a pizza!
If my IFR was not on the blink I would offer my bench.

At least Midland is honest and explains their range claim. From the manual...

ABOUT RANGE
Your GXTSeries radios are designed to give you maximum range
under optimum conditions.
Optimum Conditions are:
l Over water
l Open rural areas without obstructions
l Flat areas where you can see the other person

Clint Bradford, KAF3359

I have a pair. Output is average for bubble pack. You might get 14 miles across a valley but in real conditions they are no better than any other VHF. Communication dwindles with the first bump of land that gets in the way.
I have a bag full of this type of ht that I pass out to people that come to dog training without. These are also good to bring out on the boat if there is a chance it might go overboard. The only innovation I have seen in the bubble pack radios that is worth anything to us is the Radio Shack model that has the power boost button. This makes it normal to conserve battery power when the high output is not needed(which is almost always) and easy to boost if it will help. If you want to get a radio that has a leg up on the bubble-packs save up the pennies for a Icom F21GM. It has a real battery and a real antenna, takes an external speaker mic and can use a repeater if it is available. I got a pair on ebay for $120.

Subject: [GMRS] Midland GXT500VP4 5W "14 mile" bubble pack radios. Are they any good for a toy?

Does anyone have any experience with the range on these supposedly 5W "14 mile" Midland bubble pack HTs? They use 4 AAs for power.

Has anyone ever put one on a dummy load to actually test the output or calculated the ERP?

Thanks,

Rob

This is not an eyewitness test but you can go here, put in the FCC ID of the radio and read whatever the manufacturer submitted as reports and test results.

https://gullfoss2.fcc.gov/prod/oet/cf/eas/reports/GenericSearch.cfm

I do not have this exact model, but a pair that are 3.2Watts input, I don't know what the ERP is. With my wife sitting in our kitchen I went for a walk around the neighborhood. TX was OK for .25 miles and then got choppy and cut off very quickly. However, I drove in my car to the bank, 1 mile away and we were able to converse without difficulty. So we took these radios to the beach. I walked down the beach for 1/2 an hour (passing all life guards, jetties, rock walls etc). I hit the PTT and we conversed crystal clear. The distance had to be at least a mile (educated guess/dead reckoning).

Its not the power, its line of sight. How obstructed is the path between the radios?

I hoisted a ladder line J-Pole up a tree and connected a 2Watt Cherokee Outdoorsman to it with a 40ft length of RG8/u (1/2 inch thick) with a short piece of LMR100 to prevent breaking off the SMA connector. I took a 4 Watt ICOM F21GM in my car and started driving. Had no trouble talking at 2 miles when all went dead. I just kept talking and driving to a high spot. At the high spot I picked her up, very broken but raedable enough to find out something happened at her end. She went back to the kitchen and grabbed the bubble pack 3.2Watt and we had a barely readable conversation at about three miles. The batteries died in the Cherokee and it changed channels and then croaked. We have not had time to try the DX test again. Moral? Height is everything. Triple your height and double your distance. If you are on the ground at 5 feet, raise the antenna to 15 feet and you'll get out twice as far. Triple your height to 45 feet and you will get out 4 times as far.

The NationalSOS test in CT claims an FRS operator 105 miles away in NH heard the GMRS small base (5W) in Hartford the day of the test. They do say it was very anomalous and not the norm.

OK, maybe you will get some better data but that is what I know.

I have a pair. Output is average for bubble pack. You might get 14 miles across a valley but in real conditions they are no better than any other VHF. Communication dwindles with the first bump of land that gets in the way.
I have a bag full of this type of ht that I pass out to people that come to dog training without. These are also good to bring out on the boat if there is a chance it might go overboard. Thank you all who have chirped in on this thread. I bought a pair of these bubble packs from Sportsman guide for $37 a pair or something, so we'll see what they do. I fully expect they will perform as those of you have written. I am curious about the ERP and will check the FCC web site when I have the radios in hand.

I've got a pair of these and they seem to work better than previous radios. This weekend I was at my cabin in the mountains in Idaho and tried them out for distance. It's 2.9 miles from my house to my cabin and I was able to communicate...though a bit broken. It is more or less down a valley but there are hills between.

Hi Paul,

Welcome to GMRS, okay on setting up a repeater. I recently got back into GMRS after being away for about 10 years. I use GMRS to talk back and forth to the house, used CB before that. The range of GMRS is pretty good, providing you have a decent antenna system. Enjoy.

Hi Rob,

Try logging onto www.g-m-r-s.org, they have a list of repeaters.
There may be others out there not listed though. Good luck and enjoy
GMRS.

From: Walters
Topic: 11821 Message: 11829

Hello Paul,

There is no coordination of GMRS repeaters, at least not in the sense that Amateur repeaters are coordinated. With GMRS you listen in your area and you try to track down any repeaters you hear. Setup on a releatively open freq and choose a PL tone. GMRS system operators are alot more protective of their repeater freqs and PLs and most do not want them dicussed on the air. Some systems are totally private while others are open as long as you contact the owner off air and identify yourself.

WPUI299 Ryan who posts here often actually runs what seems to be a commercial venture as a repeater coordinator. I am sure he will post in response to your question or my post trying to answer it here.

There just is not a lot of GMRS traffic here in south central PA. I monitor 462.675 when I am in the car and have yet to hear anyone other than one repeater that transmitts its call sign in Morse code every 12 minutes. I here more car-to-car on FRS 1! The local KFC/Taco Bell drive thru headset is on MURS channel 4 (154.xxX) LOL.

Here is a website with a good deal of info on setting up a repeater.
http://www.gmrsweb.com/gmrsrpt032699.html

We'll have to see if we can hook up on AMateur sometime. I just need code for General.

From: fuzzybr2003
Topic: 11833 Message: 11833

having just received my gmrs (wqfr960) license,i'm wondering how to setup a new radio. I'm thinking of three icom's f221s set up with the first 8 channels duplex and the next 8 channels simplex. but what about tones? 141.3 in all the duplex channels? there is no repeater near me so basically in the beginning i will be using mobile travel and base to mobile.

From: kvsp1160@aol.com
Topic: 11821 Message: 11835

Hi Paul,

Stan is correct that the GMRS does not coordinate repeaters or frequencies in the same way as the ARS does. However, there are still groups and organizations that still provide that service to those who would like to provide such information to them for their GMRS system, and many are scattered across the US. You just need to know what you're looking for. REACT, RUG, and a few smaller groups used to handle this, but it's dwindled down some. But the larger states such as California, Texas, New York, and a few others still have these services.

What my organization is not, is "a commercial venture" as Stan added in his posting. We don't charge for this service. It's offered as a free service to the community and to others who pass through here (or even those on this group who need help finding info elsewhere). I work with several other groups and organizations within the San Francisco Bay Area as well as across the entire state. Our goal is to work together and not have split sections or groups. This is a good way to learn more about the other groups involved as well as being able to have access to them in times of emergency need, whether it be local or state-wide.

Anyways, back to your comment or question on coordination... When you build your repeater, I suggest (more like highly recommend) to find a frequency that it not being used or is not as active, and always use a CTCSS or DCS tone for your repeater input and output. This way, you won't be stepping on other systems, and other systems won't be stepping on you.

If you had a group or org that coordinates GMRS systems already, then go through them, and they can give you a confirmed frequency and tone that you can use without having to worry about that.

If you have any questions, or need anything... I'm always here ready to help. Just ask.

Hi Mike,

Normally, the first 8 is simplex, and the last eight is duplex. The tones are usually open on simplex, unless you specifically know what you're going to use. As for the tones on the duplex freqs, I'd leave them all open except for 467.675, in which I'd put a tone of 141.3, and that's a pretty common tone for most systems across the US, and they use that for travelers or locals who need to use a system.

The Icom's are user-programmable. This means that you can program the tones you need when you need them, but you'll also need to buy the programming cable to go with it. The software can usually be found on the web or bought real cheap elsewhere. If you have a local radio shop or radio tech who can do it instead, then the less hassle and responsibility you have to worry about.

I hope this helps. If you have any other questions, feel free to ask!

From: kvsp1160@aol.com
Topic: 11836 Message: 11844

I just love answering questions! It really get's you thinking with creativity...

Well, I have a mobile setup with a CB and a GMRS antenna side by side, and they don't cause any interferrence. But mind you that the CB is somewhat considered HF, so it's about a good 400+ MHz difference. With 2m and GMRS (462/467), it's only roughly about 320 MHz difference. Plus you have to factor in the amount of watts for each system. The GMRS could be at 35w, but you'r 2m could be a base and may be much more, whhich could cause some interferrence. Not necessarily audible to the other person on GMRS, but definately audible to you on your GMRS receiver.

As for the mounting, I'd add an arm to the pole if possible. Use a cross section and then add the GMRS antenna to it. In this way, it allows more spacing, and is not directly underneath it (in the way if the RF path, etc). It's a less chance of interferrence between the two.

I don't know how serious you want to become for either GMRS or ham, but there's always the option of buying a Ventenna for the 2m, and using the pole for your GMRS system. Not quite sure personally how well they work, but I hear that they do the job in these types of circumstances. They're sold at www.hamradio.com (HRO)

And yes, for those who want to know... I'm studying for my ham license, so I do know quite a bit from both worlds.

11851. New Member greeting and question

Yahoo group: GMRS (2005 — 2007)
Date: 2006-09-26 16:30:42 UTC
From: Ross
Topic: 11851 Message: 11851

Hellos everyone,
My name is Ross and I'm happy to find this group. I am less than a beginner in GMRS. In fact, I know absolutely nothing about GMRS except there are GMRS radios.

I recently came in contact with a man who wants to set up a GMRS emergency net in our area, especially for the many southern CA fires, eathquakes, and such that we have here. I have gotten interested in his plan and would like to buy a GMRS radio. I don't trust sales people in stores so I thought I would start off my membership by asking about purchasing a GMRS radio. I would be truly grateful if I could cut through all the sales people, ads, and such, and ask if there is any such thing as a "best radio", regardless of cost, and/or best money for the bucks. We do intend to use repeaters, so that would be a factor in the radio, if that makes any difference.

I realize you may get this question a lot. I hope I am not boring you with this.

Any help you could give me in purchasing a radio would be much appreciated.

Thank you in advance.

Directly underneath is EXACTLY what you want.
That puts is underneath the radiation pattern of the 2 meter antenna, and similarly keeps the 2M out of the GMRS antenna pattern.
The vast majority of antennas have a radiation pattern like a donut, heading out to the horizon, with the 'hole' being the antenna itself.

That same technique is used when using 2 antennas for a repeater without a duplexer. Vertical 'displacement' has over 100 times the effect of horizontal in terms of reducing signal strength.

The goal should be to reduce the signal going into the 'other' antenna as much as possible. High rf levels, even in a different frequency band, can still cause interference, and possibly damage to the receiver(s).

Walter

From: kvsp1160@aol.com
Topic: 11851 Message: 11854

Hi Ross,

First, you'll need to purchase a license which will cost you $80 (unless the fee went up) per FCC licensing for the GMRS. This license requires no testing, but it does cover your entire family and lasts up to five years. It also covers all eight simplex and eight duplex GMRS frequencies, as well as the seven shared GMRS/FRS frequencies (channels 1-7 used in bubblepacks). No, you don't need a seperate license for a repeater setup.

For equipment, all and any radio equipment used within the GMRS must be Part 95 type accepted. With that in mind, any mobile handheld or base radio that you buy or build can be used. There are plenty of commercial and business-type radios for sale that are covered under Part 95 type use. I highly recommend to stay away from any and all bubblepack junk that you'll see at your local walmart, no matter what the gimmicks and advertisements say. Many bubblepacks can't transmit farther than 1-2 miles in the city, at best.

Where to buy commercial quality radios...? eBay, rkleef.com, your local radio shop, or a search on Google for any online store.

As for starting the emergency net. You mentioned it being located in So Cal. There are several groups and organizations already established in many neighborhoods and areas that already practice for emergency and local assistance needs. REACT, RUG, CREST, and other organizations like these may be contacted for further information on their programs. They can also be used as resources and tools to learn about how their teams and organizations are structured and operated, and how you can start your own if necessary.

I highly suggest though, to get your GMRS license if you haven't done so already, and to also read the current set of rules for the GMRS as stated under Part 95:

http://www.access.gpo.gov/nara/cfr/waisidx_05/47cfr95_05.html

If you still have any questions as to how to operate and buy or build a radio system, or any other questions you may have that you need help on, we'll be more than happy to assist you.

That would be true if BOTH were dipole antennas, so we assume that they are.

But if one was a yagi and the other was a dipole or a horizontal dipole, or even a discone, it changes the pattern.

However, (forgot who said it) since the frequencies are seperated from each other so much, it doesn't matter too greatly. Except when dealing with a higher wattage. You will get some bleed.

But if, again, both were true dipole antennas, and both were operating at the same power or at a power that won't interferre with each other, then yes, the theory would in fact work.

It all depends on what equipment he's using, the space between antennas, the surrounding RF conditions, etc. (BTW, I'm not disagreeing on what you said... just expanding on the thought -- excellent point.)

Would you guys mind responding to the following reasons I'm given by people who don't want to get GMRS. I need some support in trying to set up a plan. Here are their objections to the plan:

1.Ham radio operators work more with the emergency service agencies such as County OES , Sheriff (RACES), and fire departments such as Campo Fire and Rescue.

2.The VHF and UHF Ham equipment will also receive on frequencies used by CDF, Forest Service, County OES , National Interagency Fire Center , and others.

3. The LDS Church Welfare Services department has endorsed Ham Radio for Emergency Communications. The Church office building has an Amateur Radio station on one of the upper floors of the Church Office Building as well as most of the storehouses.

Thank you for any help you can be with rebuttals or whatever.

ham radio is a better in ways like you can link ham repeaters and other things but getting a license is the thing to do in ,ham you pay at the most $20 to take
the test but your license will not needed to be renewed for 10 years then on top of that you don't have to pay for renewing you pay a one time fee the down side is that its for you only not general family and you have to take a test

Today, I do not think gmrs has muct to offer to ems. For that matter nither does ham radio. Let me explain. For close range coms ems services (most since 9/11) have comm vans that have interopibility and temporay repeaters they can bring up local coms.
To for providing replacement comms for ems nothing is needed or desired by most ems's.

Now ham radio does play well for heath and welfair messages. Nothing beats that for getting mesages out to loved ones that can not get in contact with family members in a desaster area.

Now FRS rather than GMRS is great for neigborhoods to have to communicate with each other. Buble packs are cheep and can be handed out by red cross and folks can atleast coordinate recovery efforts on their block.

A base station could be set up at the assistance centers. Rescue and ems can carry a bubble pack to be able to work with team leaders in the neigbor hoods. And yes the GMRS channels could be used and without licence. It is a disaster who cares?

I know much of this will ruffle feathers. But hey why does every radio service need to get involved in emergency comms anyway? Let the pros do their job. And use folks can work with our neigbors to get ourselves back togeher as best we can.

I have had the same type of questions in our CERT Organization.
(Community Emergency Response Team)

What I learned from these type of questions and the answers provided was that Ham radio is more versatile, covers more of the spectrum -on and on and on.

But the bottom line was that the vast majority of volunteers would not devote the time to study to pass the required test or tests to acquire a ham license. Volunteers would pay 80 dollars once for a 5 year license because there wasn't any test. People don't like to study and take tests. We have found our FRS/GMRS system - with repeater to be very effective. On our teams, most members just use FRS and do not require a license. The team leader uses FRS and GMRS and does have a license. We have two teams of 10 members, 2 team leaders, and one overall leader. Only 3 people need and have a license.

From my experience,

1. There are GMRS groups working with Public Safety Agencies, such as REACT and others. You could have more members using GMRS as you only need one member licensed and his/her family could use the GMRS system. No testing needed for a GMRS license.

2. UHF Ham equipment, these days, also receive GMRS. Ham operators could monitor GMRS and relay on Ham frequencies if need to.

3. The Church office building could also have a GMRS radio and work IN CONJUCTION with Ham operators. Again, more membership because of the ease of GMRS.

Public Safety Agencies, normally do not know the difference in what a volunteer is using for communications, only that they are needed and helping out. Unless, of course, a Public Safety member happens to be a Ham or GMRS operator.

Both systems could be used, and are being used throughout the USA.

Hope this helps,

Tell them that GMRS is cheap to get into and that they don't need to make the mistake of putting their eggs all in one basket. If I had access to a church property I'd be the first to put up both stations on site. In addition to a general 10 meter and up coverage RX like an Icom R-7000 or at least a good scanner to RX what's going on in public safety etc.

It just torques me off when I hear of people wasting a Homeland Security grant on some super expensive digital radio system when they could take 1/4th that money and outfit most every fire station, police station, hospital etc. with Amateur and GMRS radios.

From: Ben
Topic: 11864 Message: 11871

Right, the vast majority of volunteers won't take the time to study to pass the tests. That gives you a good idea of what kind of performance you can expect from them when all hell is breaking loose.

I think you will find good and bad operators both in ham radio and in GMRS services. But the bottom line is that the ham operators are the ones who had enough of an interest in radio to get off their asses, study, and pass the test. They are the ones who have taken an interest, who are more likely to use care in selecting and maintaining their equipment, who are more likely to understand proper operating procedures, who are more likely to be ready to efficiently serve in the event of an emergency. They are the ones organizing and running the messaging nets, they are the ones practicing how to get messages from one place to another through various modes. They are the ones running field days, learning to operate away from normal power and shelter...

I think all types of communication is important in an emergency, GMRS definitely has its place, it's not unimportant. But how much use is your one GMRS repeater and group of untrained (and apparently, unwilling to be trained) volunteers when no member of your group has the means to render aid nor contact anyone who can render aid. What happens when your repeater goes down? How many members of your group have the equipment or knowledge to recover communications if your repeater or repeater site becomes unavailable? A centralized, insular group is by its very nature limited because the resources and knowledge are all at the top. When things become unstructured, as can happen in an emergency, it all falls apart. Hams are more self-sufficient communications-wise and in an emergency are more likely to be able to find alternatives and maintain orderly communication come what may.

Ronny,

Absolutly! In the throws of the event anything and everything goes. I would say all emergency coms should be based on simplex analog systems. Repeaters are just not going to work in a storm like we saw in the gulf.

From: Ross
Topic: 11864 Message: 11874

Kevin King,
Please let me point out where you are wrong about the ems system:

In the San Diego area in 2005 RACES and ARES hams rescued 46 lost children, assisted in 4 medical emergencies, and an oil spill. ARES monitors 8 hospitals in the area on the ARES EMS channel. They monitor the Hospital EMS Net and pass traffic to 9 designated hospitals. They just held a simulated Terrorist Attack Drill at the USMC air station at Miramar, which was monitored by hundreds of hams throughout the county.

My wife is a supervisor of one of the biggest, most prestigious hospitals in San Diego County. She works with ARES almost on a daily basis, and in every emergency ARES reports incoming victims of the emergency to the hospitals. Once hospitals are overloaded they go on by pass, meaning they won't take anymore patients. ARES informs first responders which hospitals are not overloaded and will take the patient.

In neighborhoods, GMRS and FRS radios can support victims of tragedies like the terrible airline crash into a neighborhood several years ago. This is a good way to support neighbors and stay off the telephones, including cell phones, and even the ham nets, all which can become overloaded. In the terrible CA fires the first thing they ask people to do is STAY OFF THE TELEPHONES, INCLUDING CELL PHONES, you'll just jam up the systems. GMRS/FRS can take the loads off those systems and let communication stay open as much as possible to the public safety systems which groups like RACES and ARES pass on information to. Much of this can be learned on the San Diego Amateur Radio Emergency Services Web site. In special events such as the recent Blue Angels show at Miramar, hams are given information on how to monitor and report incidences.

Ham radio operators work very hard during the bad fires like the one that wiped out so many homes about 2 or 3 years ago. They also patrol fires--just recently, in fact.

Possibly, you can see how ham and GMRS/FRS can work together very well in emergencies.

Subject: [GMRS] Re: Advantages of GMRS

Kevin King,
Please let me point out where you are wrong about the ems system:

In the San Diego area in 2005 RACES and ARES hams rescued 46 lost children, assisted in 4 medical emergencies, and an oil spill. ARES monitors 8 hospitals in the area on the ARES EMS channel. They monitor the Hospital EMS Net and pass traffic to 9 designated hospitals. They just held a simulated Terrorist Attack Drill at the USMC air station at Miramar, which was monitored by hundreds of hams throughout the county.

My wife is a supervisor of one of the biggest, most prestigious hospitals in San Diego County. She works with ARES almost on a daily basis, and in every emergency ARES reports incoming victims of the emergency to the hospitals. Once hospitals are overloaded they go on by pass, meaning they won't take anymore patients. ARES informs first responders which hospitals are not overloaded and will take the patient.

In neighborhoods, GMRS and FRS radios can support victims of tragedies like the terrible airline crash into a neighborhood several years ago. This is a good way to support neighbors and stay off the telephones, including cell phones, and even the ham nets, all which can become overloaded. In the terrible CA fires the first thing they ask people to do is STAY OFF THE TELEPHONES, INCLUDING CELL PHONES, you'll just jam up the systems. GMRS/FRS can take the loads off those systems and let communication stay open as much as possible to the public safety systems which groups like RACES and ARES pass on information to. Much of this can be learned on the San Diego Amateur Radio Emergency Services Web site. In special events such as the recent Blue Angels show at Miramar, hams are given information on how to monitor and report incidences.

Ham radio operators work very hard during the bad fires like the one that wiped out so many homes about 2 or 3 years ago. They also patrol fires--just recently, in fact.

Ben,
This is exactly what I'm looking for. Others may not want this coversation on here, but discussions like this make people think. Only non-thinkers don't want to hear all sides of the issue. These discussions also point out the strong and weak points of every system. More than one system will always have a place in disasters like Katrina, the terrible California fires, etc.

Omigosh, Ronny,
I almost thought that was one of my posts. How can two people think so very much alike? I have a Yaesu 8900 quad band with 10 meter(so I was told) and 6m capability, as well as 2m, 440 and 220. Why they call it a quad band I'll never know. Seems to me that if it really does 10m then it is a five band.

Anyway, you, John, Michael and Ben sound like me. We bought the radios to be able to do 6m. In a disaster like the one that nearly burned out half of San Diego County a couple of years ago I want to cross-band 6m and 2m. I hope to have several people on hillsides surrounding the city have antennas and such to monitor agencies and other emergency groups.

As has been said, most people will NOT put out the time and money to get a license, take a test, put up antennas, etc. Those people can use GMRS for neighborhood watches, and hope we get around to them in a disaster long after we take care of the people who take part in the emergency net.

I've been told some amateur radios can get on GMRS. Do you have any idea which ones, and what band/frequency/whatever?

Thanks for your very intelligent response.
Ross

From: Walters
Topic: 11872 Message: 11880

One of the little secrets of the HAM community is radio mods. The manufactures leave little doorways open by building radios having common printed circuit boards with jumpers or discreet surface mount components which can be removed or moved during assmbly depending on the country of destination. The band endpoints vary by country. 440 in the US is not the same as 440 in Europe. Websites abound with tips and tricks to open up the VCOs enough to allow transmitting on bands for wihich the radio is not FCC Type accepted.

Therefore, some 440(70cm) rigs can be modded to allow TXing in the GMRS 462.XXX freqs. You will see this on eBay as a radio which has been MARS/CAP modified. None of your brothers are likely to spill the beans but you would probably not broadcast (literally) the fact you had the capability. You would simply use it as needed.

I own a Yaesu FT-60R. I have fairly wideband RX 108-999MHz. Attempting to TX out of Amateur bands results in a razz and "ERROR" being displayed. However, I can listen to GMRS/FRS and MURS and scan the same. A DC-to-daylight unit will scan from the KHz range into 1300+MHz. For GMRS I have the ICOM-F21GM which is field progarmable (w/cheat sheet) and repeater capable at 4W. I also have 2 Cherokee Outdoorsman, 2W not repeater capable but with memory scan and some other great fueatures and finally a pair of (dread) bubble packs with FRS which I can set to Low power and hand a friend and run on 1-7

Ross: FRS/GMRS is located at 462.5625 - 462.7250 and 467.5626 - 467.7250 Many if not most ham equipment can be modified for those hams with Ares and Races authorization to function in this area. Many business band radios function in this area but may not be type accepted. Working an emergency is a team effort to accomplish a positive result not a contest between emergency services. I witnessed first hand what the lack of communications did during 9-11. Many of my friends suffered and died during that terrible event. When I moved to the Orlando area I started a CERT, Community Emergency Response Team, in my neighborhood. We live in a gated community. The majority of the homes own a FRS/GMRS radio. The residents channel in our community is Channel 1.0 They go there during an emergency to find out what's going on. We have two CERT teams. Team one uses channel 10-10 Team two uses 8-8 The team leaders and the overall leader use 15-15 on a repeater. Our county uses GMRS repeaters among other systems to link to our Emergency Operations Center. Our two CERT teams use a FRS frequency and do not have to get a license but they have all been trained in radio utilization and adequate. In fact we have a class starting tomorrow night for CERT team members and residents. As you can see, we have a well thought out, integrated system and methodology. Believe me, it works.

11882. Re: [GMRS] Re: GMRS versus Amateur

Yahoo group: GMRS (2005 — 2007)
Date: 2006-10-02 00:42:30 UTC
From: John Soto
Topic: 11872 Message: 11882

Hi Ross,

GMRS and FRS frequencies are in the UHF band. They are:
FRS Channels
01 462.5625
02 462.5875
03 462.6125
04 462.6375
05 462.6625
06 462.6875
07 462.7125
08 467.5625
09 467.5875
10 467.6125
11 467.6375
12 467.6625
13 467.6875
14 467.7125

GMRS Channels
01 462.550
02 462.575
03 462.600
04 462.625
05 462.650
06 462.675
07 462.700
08 462.725

The Amateur band is known as 70cm or 440 UHF. Most of todays Amateur radios extend their receivers to receive the public safety frequencies. Amateur frequencies are between 430 thru 449.975 and the public safety, commerical frequencies start at 450 thru 512mhz. and GMRS / FRS fall into the 462 mhz. section.

Good luck on your project.

Subject: Re: [GMRS] Advantages of GMRS

OK, I'll take a stab at it.

POINT 1
I will do this through a series of quotes. I'll highlight GMRS use but it still may require a lot of reading. This link http://www.reactintl.org/tragedy_09112001.htm is the first page of all REACT team reports filed from Ground Zero in NYC after the attacks on 9/11. See the calendar. OK, but I will do some leg work for you. Each of the following quotes mentions GMRS as a means of communications for a part of the event.

Quotes:
"The Salvation Army's S.A.T.E.R.N., representative, requested REACT's GMRS & Amateur operators, to support their radio communications covering their mobile canteen vehicles and their base in Manhattan. "

"Please be advised that the Salvation Army has requested our assistance with the need for radio operators - Ham Radios Operators and GMRS Radio Operators."

"Pentagon - Washington DC - On-going Activity 9/11-9/16

Federal City REACT (FCR) FCR was using GMRS on Tuesday in the aftermath to feed back traffic reports to authorities and radio stations to help ease the traffic problems that resulted from the attacks."

"If there is a team out there that would like to make a donation to the NYS REACT Council, we could use some GMRS radios, chargers and batteries. We presently have Motorola HT-600's donated by a local dealer but could use more! Please contact us before you send anything so we can make sure we can use it. THANKS"

"VOLUNTEERS ARE NO LONGER BEING SOLICITED FROM OUTSIDE THE GREATER NY CITY AREA, as of 10/14/2001. Local volunteers are still being accepted, with preferences for licensed Amateur or GMRS operators, but other volunteers can be used as well. Operations are reportedly scaling down."

These bi-monthly REACT newsletters are filled with real life stories about GMRS and FRS being used as valid methods of communications during variious types of emergency and public events.

http://www.reactintl.org/mkt.reacter.homepage.htm

Jan-Feb 2006
http://www.reactintl.org/Reacter/full/2006_jan-feb.pdf
"Prince Georges County REACT operates a GMRS repeater atop Doctors Community Hospital. Team Membership includes both GMRS and Amateur Radio licensees, with enough overlap to provide liaison between a GMRS net and the ARES/RACES/REACT Amateur Radio nets during emergencies, public service events, and SKYWARN activations."

"One of many missions of Flagler County (Florida) Assist REACT is Skywarn. Skywarn is a program that any REACT Team can get involved with. Skywarn is not just for hams. It is for everyone. Flagler County's Skywarn operations include both hams and GMRS operators on separate nets that relay information to the National Weather Service in Jacksonville."

Nov-Dec 2005
http://www.reactintl.org/Reacter/full/2005_nov-dec.pdf

"Warstler, Justice, and Perry Police Chief Tim Escola, all wrote letters of thanks to REACT for their quick and efficient response. Warstler added, "REACT was able to meet a need that had to be filled and that would have severely tapped the resources of the local police and fire personnel..
We at EMA are happy to know that this resource is available when it is needed. It is also nice to
know," he continued, "that not only can our county get assistance from Stark County REACT when they need it, but we can also call upon your resources across northeast Ohio and the entire state."

July - Aug 2006 http://www.reactintl.org/Reacter/full/2006_july-aug.pdf

I love this article from Canada. OPP will email REACT all AMBER alerts and local teams will contact truckers on CB 19 to help spot target vehicles. Here is a quote. And most people think 11 meters is dead! Ha!

"REACT Councils in other areas may wish to contact state police about helping in a similar way with AMBER Alerts. REACTers are in a unique position to use CB to link police and truckers in the effort to end a child abduction before a tragedy occurs."

OK so I think we can dispell the fact that HAM operators thru ARES/RACES have somehow cornered the market of helping EMA and emergency services. Here is the problem. People don't know what they don't hear. What gets reported is all most people know. Joe Citizen is not going to be looking at back issues of The REACTer for news about groups OTHER than HAMs helping with communications in emergencies. BUT THAT DOES NOT MEAN IT IS NOT SO.

POINT 2
Not all HAM gear has wide scan capability. It is true that newer radios do. They call it "DC to daylight" wide receive. Some have less and many HAM radios do not have any receive capability outside the established Amateur frequencies. A GMRS operator can acheive exactly the same thing by owning a good scanner. eBay is a great source for good used and working electronic if one excercises a small degree of prudents. As more and more counties and jurisdictions move from traditional radio operations and start using trunking systems, simple wide band receive capability on HAM gear won't mean much unless the HAM radio has a trunking scanner built in.

POINT 3
It is true that the LDS church is/has setting up a HAM network and encouraging members to get their licenses and gear. But that is not to the exclusion of anything else. The LDS church promotes self-sufficiency, self-preparation and finally community involvement of any kind. I am LDS and we are currently running a CERT training class at our chapel with county EMA staff more than happy for the 30 student class. When they graduate they will increase the number of CERT volunteers in the county by almost 10 percent. However, we also have a county-wide REACT team which meets at our chapel monthly. The team is made up of citizens of the county and some are church members. We have 2 HAMs, 4GMRS licensed operators and the rest have yet to own radios. No one can deny that as a backup stratedgy Amateur HF can link sites over long distances. However, for family activities or line of site car-to-car nothing can beat GMRS or FRS. As has been said, when all forms of communications are down, anything is better than nothing.

Infact here is a website containing the details of one LDS congregation conducting net radio operations during a disater exercise on FRS 4!
http://www.uema.net/Summer%2006%20newsletter.pdf#search=%22lds%20gmrs%22
This could not have been done without the knowlege of local church leaders.

Well, I hope that helps. My logic may have started breaking down as the hour became late. When infrasturcture gets ruined, 2m and 70cm repeater sites could get wiped out too. Once you are down to simplex operation, GMRS and 2m/70cm HTs are all about the same. Height is king. triple your antenna height and double your distance. See the radio band use chart at this site.
http://emcomus.org/commwp.html
Individual families with FRS feed to GMRS operators who are our feed up to HAMs who then have the distance capability to get help.

OK, enough from me, good luck.

Subject: [GMRS] Advantages of GMRS

Would you guys mind responding to the following reasons I'm given by people who don't want to get GMRS. I need some support in trying to set up a plan. Here are their objections to the plan:

1.Ham radio operators work more with the emergency service agencies such as County OES , Sheriff (RACES), and fire departments such as Campo Fire and Rescue.

2.The VHF and UHF Ham equipment will also receive on frequencies used by CDF, Forest Service, County OES , National Interagency Fire Center , and others.

3. The LDS Church Welfare Services department has endorsed Ham Radio for Emergency Communications. The Church office building has an Amateur Radio station on one of the upper floors of the Church Office Building as well as most of the storehouses.

Thank you for any help you can be with rebuttals or whatever.

Be careful, guys.
GMRS/FRS requires FCC type accepted radios, which ham radios are not.
You can monitor with modified ham radios but cannot legally transmit.

I'm letting some messages be posted because they are showing the strong points of each service without too much negative comparisons.

This is an emotional subject and again, I don't want it to get out of hand. As I said before, both have a lot of offer, and each should know about the other. But neither one is 'better'. They're different services for a reason.

So, lets wrap up the comparison conversation and move on with more things about GMRS. Other mailing lists are for ham radio.

Thanks.

Ray, list owner and moderator.

None of your brothers are likely to spill the beans but you would probably not broadcast (literally) the fact you had the capability. You would simply use it as needed."

I value my licenses. Therefore, I use type accepted (certified) equipment where necessary, and then use the same equipment on the amateur bands as well. Getting caught with your hand in the cookie jar means possible revocation of ALL your licenses, as well as a monetary fine...

> with Ares and Races authorization to function in this area.

First off, this post is not intended to flame or start an exchange
of highly emotional responses.

ARES, RACES nor any other organization or agency, FCC excepted, has
any authority to authorize un-licensed usage on ANY
frequency...the "life or death and/or property damage and NO OTHER
communications means available" waiver also excepted. And there
better be no other means available if one uses a frequency in which
he has no license!

As the ARES Emergency Cordinator for my county, I would never ask or
allow any of my members to utilize any frequency (or modded radio)
that they were not authorized to use. As hams, not only do we have
an obligation and mandate by Congress to assist the public during
times of emergencies, but we also must be the first to set examples
of how to play by the rules!

I often question the motives when I hear of organizations using GMRS
channels by unlicensed persons, if such use is an absolute necessity
or is it nothing more than a matter of convienence. It is so easy
to outfit a CERT team (of which I also am a Team Leader) or other
organization with bubble pack radios and justify using the pure GMRS
channels illegally in the name of "emergency". In the vast majority
of circumstances, it normally doesn't hold water. Our CERT teams in
my county were issued hybrid GMRS/FRS radios along with our other
gear. I pointed out very quickly to our commander/instructor (a
fire department captain), that even though there were 22 channels on
the radios, we could utilize only certain ones.

We as hams have a higher standard to uphold. The FCC, in all of
it's wisdom, have allowed us to "self-police" our service. There
are always some sour apples in the batch, but if we are to try to
keep the respect and privileges we now enjoy, we must always strive
to do the right thing.

Also, after doing a "mod" on a ham radio, how many folks sweep the
output for spurs? I have see some on a service monitor that when
transmitting out of the spec'd range, send spurs all over the place.

Bottom line is use the proper radio for the right job and be licensed for the frequency you are transmitting on.

Like I said in the previous email - This is not a contest - Amateur Radio license holders, like myself, that are members of ARES and or RACES, can have their amateur radios modified for use. Don't look to find someone or something wrong, add something useful and constructive to the conversation. Negative people just tend to isolate themselves because of their negativism.

11895. Type acceptance

Yahoo group: GMRS (2005 — 2007)
Date: 2006-10-02 18:37:49 UTC
From: Ray_Vaughan_99
Topic: 11895 Message: 11895

Just a reminder:

Any radio used in the GMRS radio service MUST by FCC type accepted in Part 95. Just 'type accepted' isn't enough. The radio specifically must be approved for use in Part 95.

There is a way that some of use one radio for both ham and GMRS. We use commercial grade radios that are type accepted in Part 95. In my case, a Motorola Saber UHF handheld radio. It is accepted by the FCC for use in Parts 95 and 90. Since it can also function well in the ham 440 band, I use it there also. Perfectly legal.

Taking your 'type accepted' amateur radio and modifying it for use outside of the ham band, is sometimes permitted by those who have permission to use the CAP and/or MARS frequencies. But that's as far as it goes. You may NOT use such a radio in services governed by Parts 90, 95 or others.

Argue if you wish, but only if you cite a specific FCC rule to the contrary. Quote the entire rule, and cite where you found it, such as a web link to we may check the entire section of the rules.

This mailing list will not support the illegal use of improper radios in the GMRS service.

Ray, List owner and moderator.

From: Walters
Topic: 11897 Message: 11897

The last few days discussion have been very informational. Ross did not know what he was starting, LOL. I think the group is fairly unified in its thinking.

1) Stay legal, use each radio for its intended purposes.
2) There is in fact a valid use for different radio services, working in a coordinated effort
3) Serving the public, educating the public, improving the services, saving lives

And as this is the GMRS forum, what better than discuss various ways we use GMRS to benefit ourselves, our families and the public in general.

With that in mind, I had a 15Watt Regency Repeater with duplexer given to me. I have also been given space on a tower and all the hard line I need for hook up (I know, a better gift I could not get). The tower sits at a fairly high point although not the highest terrain in the area. However, the tower is 100 feet tall. What recommendations do peole have for an antenna and what kind of coverage can I expect. I am in York County PA with a terrain made of olling hills and woods with occassional housing deveolpments until you hit the city of York PA, about 10 miles north of the repeater site.

Topic: 11864 Message: 11898

I've been watching the posts fly back and forth and I stayed out for a reason this time. But I would like to add a very important point to this...

There are equipment that is certified for Part 95 AND 97. What you can do is TX and RX on the same unit for both amateur as well as GMRS. What you cannot do is cross-link the two frequencies so that they can hear each others transmissions. That is illegal and is covered in both Part 95 and 97 of the FCC rules. [See 97.113(5) and 95.183(13)]

I support the amateur radio community 100%, and I support the GMRS community 100%. It all depends on what your city, town, or area needs for communication needs. It's not a place to compare who's service is better, and yes even though the ARS has more to offer in equipment mods and accessories, GMRS also has more to offer when supporting families and neighbors when in a time of need.

There are also negatives that come with every radio service. Every service. No matter how you look at it. So no one single radio service stands out and is better than the other. It's only your personal opinion that helps make it stand out.

So, in conclusion... they're both good services, and you'll both be relying on them when in a time of need. But whatever radio you feel that you can use more efficiently for you as well as for your family or for your community, that's the radio service to use. In any given situation.

Topic: 11864 Message: 11899

Well, yes and no. Anyone selling radio equipment for the amateur
bands
has to get FCC approval. An amateur operator building or modifying
equipment for their own use* does not have to get FCC approval - the
only radio service that doesn't...and good thing! I'd hate to have
to
send my Motorolas, Kenwoods, GEs, EF Johnsons, etc. that I use on the
Amateur 900 band to Gettysburg for approval!

My GE Mastr IIs for my (someday) upcoming repeater ARE FCC approved,
and must be per Part 95 (47 CFR 95.129).

*Exception: Amateurs may only build one external RF amplifier for use
below 144 MHz per year (47 CFR 97.315).

I'm correcting myself: The equipment needs to be certified for parts 90 and
95... not 97. The rules to be found for cross-linking can be found in part 95
for GMRS and part 97 for ARS.

11902. type accepted in Part 95

Yahoo group: GMRS (2005 — 2007)
Date: 2006-10-03 11:33:09 UTC
From: Michael Fontana
Topic: 11897 Message: 11902

Ray V. In a message you stated the following:
Any radio used in the GMRS radio service MUST by FCC type accepted in Part 95. Just 'type accepted' isn't enough. The radio specifically must be approved for use in Part 95.

There is a way that some of use one radio for both ham and GMRS. We use commercial grade radios that are type accepted in Part 95. In my case, a Motorola Saber UHF handheld radio. It is accepted by the FCC for use in Parts 95 and 90. Since it can also function well in the ham 440 band, I use it there also. Perfectly legal.

I think it would be quite informative if you stepped the group through the steps, via which web sites, were used to make the determination that a Motorola Saber UHF handheld radio was type accepted in Part 95. This procedure could then be followed by anyone wondering if in fact a radio they were considering using was indeed type accepted in Part 95. Thanks for your efforts in running this forum.

Mike

[mfontana1@...] wrote:
Ray V. In a message you stated the following:
Any radio used in the GMRS radio service MUST by FCC type accepted in Part 95. Just 'type accepted' isn't enough. The radio specifically must be approved for use in Part 95.

There is a way that some of use one radio for both ham and GMRS. We use commercial grade radios that are type accepted in Part 95. In my case, a Motorola Saber UHF handheld radio. It is accepted by the FCC for use in Parts 95 and 90. Since it can also function well in the ham 440 band, I use it there also. Perfectly legal.

I think it would be quite informative if you stepped the group through the steps, via which web sites, were used to make the determination that a Motorola Saber UHF handheld radio was type accepted in Part 95. This procedure could then be followed by anyone wondering if in fact a radio they were considering using was indeed type accepted in Part 95. Thanks for your efforts in running this forum.

Ryan,
Your last post (I think it was) talked about some GMRS radios
communicating with some HAM frequencies. I would like to purchase
(legally)such a radio. I have 440 on my quad band and it might
sometime be necessary to communicate with a GMRS. How is that done?
I'm pretty sure that would have to be simplex. I know a GMRS can
use repeaters, but they can't use an amateur repeater, can they?

Mike, what other radios besides the Saber, which is tricky to deal with, and sometimes hard to get can be used for both HAM and GMRS? The Saber won't be seen in any stores in my area. I've never even heard of it let alone seen one in any kind of radio store. I wouldn't buy one online because I'm told there are various kinds, and not all can use HAM. What do I need to look for if I come across one? No one is going to let me take their radio apart to see what it will, or cannot, do.

We sell a number of the Icom radio's that can do 400 to 470 and are type approved to do that.

Also Kenwood have a number of radio's that do the same.

Ross

GMRS and Ham 440 frequencies are 2 different animals. GMRS is in the 462 and 467 MHz regions and 70cm (440) ham goes from 420 to 450 MHz. A part 95 certificated radio (GMRS) is OK to transmit on ham frequencies (with a ham license of course) but a ham radio (Yaesu, Alinco, some Icom, etc) are NOT allowed to transmit on GMRS frequencies even with a GMRS license. Same is true with transmitting through repeaters.

Stan,

In reply for your question of your new setup, are you trying to aim your signal in one direction or in an omni-directional pattern? I have a few antennas that I've used over the years, and a few that I've read about that I can suggest. But it depends on what you want as far as the performance of the receiving signal.

We can discuss it on here, or on the side if you prefer. Anything else you need, just let me know.

Wellllllll.....
Any radio that's going to be Part 95 type accepted AND capable of
70CM ham, is going to be 'tricky'.

And NONE of those radios will be seen in 'stores' [with the
exception of pawn shops]. These are commercial/public safety grade
radios, and are not [usually] found in any sort of storefront
operation. Not even ham stores [what few of those there are left].
Sabers,and a whole lot of other types of radios like you're asking
for, are not marketed through 'stores'. They used to be sold
directly to the campanies/agencies that needed them. And you
couldn't afford a new Saber.

That being said, there is a large industry dedicated to the used
market for these. And a fair number of them do business on the web.

There are a number of them here
<http://www.twowayradiodirectory.com/>

What you're looking for is a radio that goes from 440 to 470 MHz and
is less than 50 watts out.

Hi Ryan,

OK, thanks. I think it is info others may benefit from. Let's do it here.

I want an omni directional pattern. I want to have "good" ears for neighborhood activities. I am a REACT monitor and intend to listen on FRS 1 No Tone and 462.675 (tone undecided but 141.3 likely). We are doing this with the cooperation of the local HAM repeater club (its their tower) and I think we will run the repeater on .675 but I don't know. The repeater is going to be about 5 miles away at an elevation of around 100 feet above the surrounding terrain. My local antenna height restriction are stricter than FCC rules so that's what I have to abide by. The tip of the antenna cannot be taller than double the height of my home. Therefore I can get my antenna roughly 40 feet off the ground on a roof mounted mast or I can get perhaps 10 feet higher up a tree. Excepting vegetation I would have line of site to the repeater tower.

I hope this is enough info.

> ground on a roof mounted mast or I can get perhaps 10 feet higher up a tree.
> Excepting vegetation I would have line of site to the repeater tower.
>
> Now we're talking about an antenna for the home? Since you're monitoring more than one specific frequency, I'd recommend the discone antenna. Contrary to what others believe or have read about, or even have experienced, I own one. I would never sell it nor would trade it for anything else. I tuned the vertical whip (like a dipole) to the GMRS frequency, and then the ground-plane radials would be used for the receiving end.

> In this case, you'd use it to TX to your repeater or the FRS freqs. and can listen on both. While it's not important to have a tuned antenna to listen to the receiving frequencies, it is very important to have a tuned antenna for your GMRS freq that you want for the repeater.

The discone can be found at Radio Shack (ya, I know... don't start) for about $65, and is only 3-4 feet tall. It comes with a built in mounting mast so you can add it to any mast of your own. The discone can receive from 25-1300 MHz, and can be tuned to TX on 6m, 2m, 220, 440, 512, 800, and 1.2 GHz. Since GMRS

is fairly close to the ham band, the antenna tunes up real nice and has a SWR rating of about 1.2:1 to 2:1 (depending on how long your coax run is). This antenna has a PL-259 connector.

> The other antenna I was going to suggest to use was a yagi beam antenna. It's nice and handy, and small. It only uses 3-4 elements for the GMRS, and can direct your signal to the repeater without having to worry about loosing the signal in those trees and hills. It's a line-of-sight antenna. They can be picked up on eBay. Do a search there for "yagi antenna" and then sort out the ones that are either made for the business bands (450-470) or there are even some that are pre-made for the GMRS. They run around $39 and have a N-male connector.

> I think that's it. See what other's on here have to say. But this is my personal experience with the antennas. And I've used them in your situation before. Like I said, they never failed and I'll never give them up.

Hello Ryan,

Wow, thanks, great info. Yes, Radio Shack has detractors . . . I still buy stuff there, LOL.

You did a nice job figuring out I was talking about home as well. In the meantime I found out that at the repeater site the previous users left all their feedline and antennae up the tower. The local HAM club guy thinks there is a suitable antenna up there. I have looked at it in passing and see 4 white verticals (fiberglass?) so at this point I am in a wait and see on the repeater side. I have heard of the Hustler name so will keep that in mind if purchase becomes neccessary.

I like the discone with the mast offset. I would really like to have all my antennae hanging off a single mast but have had a hard time finding those until recently. That's a good thing. I have a dual band 2m/70cm Tram for the HAM side and plan to eventually have 11m (CB) along with the GMRS/FRS. I also like the yagi pointed at the repeater idea too. What is my house going to look like? LOL.

Maybe my setup will be discone for omni for simplex neighborhood monitoring, yagi for repeater. I have the feeling I am still going to need two masts but will burn that bridge when I cross it.

Thanks again, hope everyone else can get something usefull from this discussion,

a very good point my opinion as well. Unfortunatly not taken seriousl in all parts of the country. our repeater is being jammed as type this very moment.

[kvsp1160@...] wrote:
I couldn't care less if the business (of any kind) was on any GMRS frequency, as long as they have a license that is current; a grandfathered license that may cover the entire business, or indivual licenses for all employees that operate the radio equipment (how many there may be).

What I care is the fact that a business or individual is using any GMRS frequency without a license, and/or is violating Part 95-Subpart A in any way or form. This includes 95.127 and 95.141 which refers to linking and autopatch.

There are also other area that I/we/others have to cover and make sure it doesn't happen, such as TPO wattage, interferring with REACT or other emergency communication systems (simplex or duplex), illegal operations of equipment between services, etc.

If we didn't care and allowed this to happen, then GMRS would become another Citizens Band service where the FCC doesn't really monitor or care what goes on with the associated equipment, language, users, etc.

So it takes individuals and organizations like mine to handle these types of problems and resolve them as quickly and quietly as possible. General Mobile Radio Service should be a place where individuals and families can come to communicate with each other as well as have a place to learn about the world of radio communications. A place where we can provide the community with emergency and non-emergency services and communications in times of need. Without rules and regulations, restrictions and guidance, you can forget about those nice repeater systems and start using bubblepack radios again... Kinda hurts thinking about it, huh?

Not true anymore. I'm not sure of the time frame when it was dropped, possibly when they did away with the GROL. Also, the requirement of having a GROL or greater to align a transmitter has been dropped as well.

So, program and tune-up to your heart's content...just make sure you know what you're doing and have the proper equipment and knowledge.

And your other question about LMR equipment...stands for Land Mobile Radio...an older term for PLMRS..Private Land Moble Radio Service...business, public safety, etc. Yes, as long as the equipment is part 95 certificated and has no more than 50 watts output, it may be used on GMRS. With what GMRS usage it can be utilized (base, small base, mobile, fixed) depends on the specs of the individual radio.

>>...been using this device for a year now. Works very well...

Unfortunately, its use with FRS or GMRS units is quite illegal.

Can't connect FRS/GMRS radios to the telephone network, according to FCC rules.

Sec. 95.141 Interconnection prohibited.
No station in a GMRS system may be interconnected to the public
switched telephone network except as and in accordance with the
requirements and restrictions applied to a wireline control link (see
Sec. 95.127).

When I brought this fact to the attention of the manufacturer, he claimed ignorance...

Here's their take on the matter:

"DingoTel's US distributor has been advised by the FCC that the product does not require approval from the FCC as it is not a radio itself. The device is viewed as an accessory for walkie talkies. The device can fit both business and consumer style radios. The device is not designed to be an FRS, a GMRS, a VHF or any other frequency specific product. It is very universal since it simply plugs into the earpiece of practically any type of radio. There
is no FCC number for radio transmission for this product since the FCC advised our distributor that there is no need. The device does comply, and has been tested, for the FCC guidelines for part 68 (I believe that is the right number) regarding unwanted electrical interference. i.e. It has passed the tests that almost all electonic products must
pass. The product is also CE and UL certified."

And so it goes....

The FCC GROL is alive and well, but really has very limited use any more. It still looks great on a resume. GROL did replace the First and Second Class Radio Telephone License.

Remember, when the FCC phased it out (one of many mistakes they made under Regan) they didn't remove all responsibility. They just moved it from the tech to the licensee. So now the TV station general manager has to decide if I know how to tune a TV transmitter. Yeah, like that's a good idea.

Ray, Ham, GMRS, LMR and GROL (w/Radar)

"interconnection" isn't as well defined in the GMRS rules as it is in the MURS rules.

"Interconnection Defined. Connection through automatic or manual means of multi-use radio stations
with the facilities of the public switched telephone network to permit the transmission of messages
or signals between points in the wireline or radio network of a public telephone company and persons
served by multi-use radio stations."

I think the important piece here is that the communication between the MURS radio AND points in the
wireline or radio network of a public telephone company are prohibited.

If one end of the conversation is NOT a point in the wireline or radio network of a public telephone
company, then this doesn't apply.

"Wireline or radio circuits or links furnished by common carriers, which are used by licensees or
other authorized persons for transmitter control (including dial-up transmitter control circuits)
or as an integral part of an authorized, private, internal system of communication or as an
integral part of dispatch point circuits in a multi-use radio station are not considered to be
interconnection for purposes of this subpart. "

I suspect that this was the same for GMRS, though it's not as clear.

can any one shed some light on this?

[m51f08@...] wrote:
Hello all,

I have been out of GMRS for about a decade, and back then used Motorola radios that had to be programmed by the dealer. Initially it was free, but then it was $25 per radio to reprogram.

Now I am getting back into GMRS and notice that some of the radios are owner programmable, using a PC. Has anyone done this, and what was required besides a cable and the programming software?

Thanks.

Mario, KAF5755

Thanks for the reply, and offline responses. Its hard to stay legal with the devices being presented as they do. I also was some what ignorant on the phone line use even though it is not directly connected to a phone as in an amateur auto patch configuration. I want to see GMRS use grow and be used legally. Hopefully others who might be considering devices such as this are now better informed..

The word 'switched' is key to understanding this rule.

Switched means how you connect to another point in the network. When you pick up your phone and dial a number, you're using the switched network. The tones are decoded and a phone company Central Office Switch looks up the end point you want and connects you to it.

While it's the most popular service from the phone company, it's not the only one. Point-to-point connections, both analog and digital, have been used, Legally, for years to link repeaters from all sorts of FCC services. Nothing is switched, so this rule doesn't apply. If you can't 'dial' it from a phone, it's not a switched service and this rule doesn't apply.

Icom's f21gm is repeater capable. Other commercial quality radios such as the Tekk GT-90 can be programmed to talk on GMRS repeaters.

Oh,

Forgot to add... I also own the Solarcon A99 for a CB base antenna. It's roughly 18' tall (three 6' sections), has a PL-259 connector, and has a max power rating of 2000 watts. And yes, I did say 2k watts. Wow!! It comes pretuned to the 11m band (CB), but can be retuned to the 10-12m bands by using the tuning rings on the base of the antenna. Price is about $69.

I own the original A99, and that cost me $99. I've had it for well over 6 years, and it has been through 50+ MPH winds, T-storms, and has skipped signals acorss the states to Alabama and Florida from California using a basic mobile setup (no linear needed) (yes, 4 watts TPO...).

Also, Rat Shack carries a black whip mag-mount antenna, that can be used as a base. Pretty good performance too. 1.5 dB gain with base coil and good swr ratings.

If you can track the signal and find out that the user is unlicensed, you as the owner can take action to resolve the issue. If they are licensed, you'll have to work with them or report them to the FCC. Although everyone hates that last statement I just made. The FCC really doesn't do much for us. So you have groups like myself who track and resolve the problems for you.

Topic: 11686 Message: 11953

Joe,

The F21GM is fully user programable. You have 8 GMRS channels with simplex or duplex on CH 1-8 Starting on CH 9 you have FRS 1-7 which are the shared FRS/GMRS freqs and finally CH 16 is scan.

Here is a simple chart. Maximize your window and I hope everything klines up.

```
Turn power on (P)ush or (H)old Hear beep
while holding (L)ong/(S)hort Setting
------------------- ----------------------- --------------------- -----------------
PTT+MONI P MONI S 1 Watt
P MONI S S 2 Watts
P MONI S S S S 4 Watts
Turn unit off and back on

PTT+MONI Set CH + P W/N S Simplex on current CH
Set CH + H W/N L Duplex on current CH
Turn unit off and back on

PTT+MONI+W Set CH + H MONI S
P PTT for 10s
P MONI n times (or none for 0) n S Sets 10s place for PL code
P PTT for 1s
P MONI n times (or none for 0) n S Sets 1s place for PL code
Turn unit off and back on

PTT + W/N P MONI S Increase Squelch
P W/N S Decrease Squelch
Turn unit off and back on

MONI + W/N Set CH + H MONI S CTCSS Tone search starts

With radio running in normal mode:
P W/N sets WIDE H W/N sets NARROW
P MONI sets CTCSS Tone squelch ON
H MONI sets CTCSS Tone squelch OFF
```

Now, I am not sure what else you want to do, that should cover all options in the GMRS and FRS service. GMRS licensees are allowed removable antennae and up to 5 whats on the shared FRS channels so there are no violations of rules with this radio.

Best wishes,
Stan Walters

Yea, but Ray the FCC isn't issuing any "new" GROL's...correct? If so, I may have been thinking about the 1st and 2nd class licenses.

The F21GM is a GMRS radio. My understanding of the
rules and various interpretations I have seen is that
it is allowable for this radio to use the coallocated
FRS radio frequencies (GMRS has primary authorization,
FRS is secondary ?. The arguement is moot when one
considers the power level of the radios involved and
the capture effect of FM receivers
). As a GMRS radio, you are obligated to follow the
rules of GMRS - posses a valid GMRS license and
provide proper license identification.

Off the top of my head, I cannot remember the rules
for use of a GMRS radio on the interstitial
frequencies also granted to FRS.

Stan,

It seems like you belong to a Home Owners Association of some dort? I'm about to install my 20' tower here at my house, which has a HOA as well. I asked a neighbor about the rules, and he said this: Never ask for permission... Always ask for forgiveness.

You may just want to do the same thing, but still try to keep it as simple as possible without disrespecting the neighbors views and property around them. If they ask, it would be a great ice breaker of what you do and they may just let you keep it up.

As for those vertical antennas at the site, do some research on them before assuming that they are 440 or 462 freq worthy. They may be way off your frequency and may alter your repeater operation. There is a way to tune them, but I leave that up to the factory or shop.

Let me know your progress. 73,

Radio,belt clip, and antenna only. Works great. The battery was lost and I'm moving to a different radio brand. PC Programmable with DOS. I can get it programmed for GMRS or Amateur to your specs before I ship with a list. It does PL, DPL and DCS.

$65 including 50 state US shipping. Specs here at the Vertex web site.

Not true. I can get programming software from the internet for free. Any software for any radio. And people have come to me for software for their radios. It's all perfectly legal.

As for eBay there are radios on there made for ARS, for GMRS, and some that were hastly converted or built to try to be compatible with GMRS for your use, but you have to be responsible for their type acceptance. If they aren't Type 95 (Part 95) Certified, then you can forget it.

Even the GE Mastr Exec II radios I have here at my shop are a great example. Before I bought them I had to do ample research to see what their Type was. They are so old that they aren't listed in the current FCC database. So I had to search thru other databases and groups for the answer. I finally got my answer: the Transmitter is Type accepted for Parts 90 and 95. That meant I could use it for both GMRS and ARS. No questions asked. So I bought it and am now using it for our repeater system.

The point to all of that is this: It doesn't matter what you hear or read about or see. Nothing is true or in cement unless you do your research and find the truth and answers out for yourself. If the FCC didn't say it, or if it's not in the FCC database, it doesn't exist. If it's older and you can't find your answer with the FCC, don't give up. The equipment you're using may or may not be usable with the radio service you're on.

Mike,

The Midland 70-440 will do the trick, plus you can
add ham channels if you desire. I think they will do
99 channels in all. check out R K Leef's website for
more info.

Kevin writes: "The F21GM is a GMRS radio. My understanding of the rules and various interpretations I have seen is that it is allowable for this radio to use the coallocated FRS radio frequencies (GMRS has primary authorization, FRS is secondary... as a GMRS radio, you are obligated to follow the rules of GMRS - possess a valid GMRS license and provide proper license identification."

If the user is licensed for GMRS, fine. But to use the F21GM as a FRS radio (unlicensed) is not legal - being equipped with a detachable antenna makes the radio not legal for FRS service.

Hello Ryan,

Ok on checking those existing antennae, don't want to blow outputs on bad or wrong antennae.

I live in PA so every little town is a Borough. If you are not in a Borough you are in a Township. My Borough has the rule. I cannot get the tip of my antenna higher than 2 X the height of the house.

I also plan on putting up an 11 meter stick, 5/8 wave. I won't be able to use any mast at all really with that one. It will be almost 2 X the height of the house after it is assembled, LOL.

Later,
Stan

Stan,

It seems like you belong to a Home Owners Association of some dort? I'm about to install my 20' tower here at my house, which has a HOA as well. I asked a neighbor about the rules, and he said this: Never ask for permission... Always ask for forgiveness.

You may just want to do the same thing, but still try to keep it as simple as possible without disrespecting the neighbors views and property around them. If they ask, it would be a great ice breaker of what you do and they may just let you keep it up.

As for those vertical antennas at the site, do some research on them before assuming that they are 440 or 462 freq worthy. They may be way off your frequency and may alter your repeater operation. There is a way to tune them, but I leave that up to the factory or shop.

Let me know your progress. 73,

11964. GMRS/FRS Confusion

Yahoo group: GMRS (2005 — 2007)
Date: 2006-10-16 05:44:47 UTC
From: Walters
Topic: 11964 Message: 11964

WOW there is a lot of confusion about these rules. 1st the ICOM F21GM is a GMRS radio, not an FRS radio. It is not a combo or a bubble pack. It is accepted under part 95.

Section 95.29 (f) states that a mobile station or small base in simplex mode may transmit on the "shared" interstitial channels under these conditions: voice (phone) only, no one-way paging, no more then 5W ERP.

That is NOT an FRS rule, it is a GMRS rule. Therefore, under this rule the ICOM F21GM, with an external antenna no higher than 20 above the ground or the building or tree on which it is mounted, and at ERP under 5 watts may transmit on the interstitial frquencies to other GMRS stations and FRS stations. This is because it classifies as a small base using limited power of less than 5 watts ERP as long as your antenna does not exceed the rule's height restriction. IF your antenna is higher, then you fail the test for a small base and you would be in violation of the rule. See 95.52(b). If you fail to account for antenna gain and cable loss you could push your ERP over 5 watts and fail this rule again.

The F21GM does NOT untilize the solely FRS simplex frequencies in the 467.XXXX range, they ain't there to use. Therefore it IS allowed an external antenna under part 95 rules because it IS NOT limited to .5 watts because it does NOT use the 467.XXXX interstitial freqs for FRS. AND furthermore the rule allows 5 watts ERP on the shared freqs.

The F21GM can become a GMRS base or mobile with an antenna higher than 20 feet and an RF amplifier as long as output power does not exceed 50 watts. When in this mode of operation you would be in violation of 95.29(f) if you used the shared FRS channels.

SO, the operator MUST read and apply the rules to his/her own situation. In my case the antenna will be higher than 20 feet off the ground but NOT higher than above the tree. Therefore it will meet the small base requirement for antenna height. I will keep my ERP below 5 watts by computing the sum of the gains and losses of my my antenna system WHEN I am talking to FRS units on the interstitial freqs. OTHERWISE I can run 4 watts on the radio when on GMRS only channels.
On the F21GM channel selector, CHs 1-8 are the GMRS channels and 9-15 are the shared FRS interstitials and 16 is scan. You can always scan.

In my car I have an antenna with 5.1db gain. I have 9 feet of RG-8X going into the car so I think I need to lower my output power to 2 watts on the radio if I want to talk on the shared FRS interstitial freqs. Otherwise I can run full power if I need it to talk to my base in simplex or hit my repeater in duplex.

Well, if anybody reads the rules and thinks different, let me know. This is a case of Occum's Razor, the simplest answer is usually the right one.

I have the same problem - the HOA forbids external antennas - so I built mine into the walls when residing my house. One antenna cannot get into a local repeater, so I installed a J-pole on the outside of the house, carefully concealing it under a vinyl drainpipe extension. The butt of the J-pole and the coax come out of a vertical piece of plastic pipe. What the HOA doesn't see they can't complain about.

Hey Duane,

Masterful disguise, cool! Fortunately I do not have to live with a total prohibition on antennae, just a height restriction. And there is no rule about usiong trees so that's wheer the GMRS antenna is going to go. I have a J-pole made out of ladder line mounted inside a peice of PVC pipe. I can paint the pipe camo and puit up the tree, same deal, what they don';t really see won't bother them. Besides, most of the neighbors are very interetsed in have a comm center down the street, LOL.

Here's a very simple, straight forward, and easy to understand version of the FRS and GMRS rules from what you are confused about:

Under FRS rules, you may not use a radio with a detachable antenna, and you may not use more than 500 milliwatts (.5 watts) of power.

Under GMRS rules, you may use FRS channels 1-7 (462.xxxx), and are allowed to have a detachable antenna. But you may not be allowed to use more than 5 watts of power on those FRS frequencies (under your GMRS license).

Both of these versions of the rules can be found here:

FRS Units: 95.194
http://a257.g.akamaitech.net/7/257/2422/09nov20051500/edocket.access.gpo.gov/cfr_2005/octqtr/47cfr95.194.htm

FRS Maximum transmitter power: 95.639(d)
http://a257.g.akamaitech.net/7/257/2422/09nov20051500/edocket.access.gpo.gov/cfr_2005/octqtr/47cfr95.639.htm

FRS Transmitter Antennas: 95.647
http://a257.g.akamaitech.net/7/257/2422/09nov20051500/edocket.access.gpo.gov/cfr_2005/octqtr/47cfr95.647.htm

GMRS Channels Available: Part 95.29(f)
http://a257.g.akamaitech.net/7/257/2422/09nov20051500/edocket.access.gpo.gov/cfr_2005/octqtr/47cfr95.29.htm

Hi Duane,

I agree. I have these huge 3-story evergreen trees that my neighbor owns. I'm going to try to use them as part of my cover for the 20' tower I'm installing. From where the proposed location sits, you can only see the tower if you're standing right in front of my house on the sidewalk, facing directly at the tower. What you can see from everywhere, would be the antennas.

I'm also buying a military 6x6 cargo truck this Christmas... That's another topic in itself, so I'll see how that goes. =c) If you're ever in the area then and see one driving down the road with antennas on it, chances are that it's me.

Tom
I believe that was for Amateur Radio only
and it was called PRB-1
It wsas generally a guide to say
the local govt should allow a radio amateur to be
allowed the minimum height required to properly
operate
a station. you still had to fight with the Town...
Most local govts set it up so now instead of no
antenna.. they allowed antennas but set a 50 foot
height limit.
thats what my township did.... Big Deal I have
90-110
foot trees.. I wanted a 100 foot free standing tower
so my antennas can clear the Tree tops...
they said my ground elevation was 120 feet I should
still get a signal out at 120 feet ASL Im still in a
valley.

Craig,

Find the FCC ID on the bottom or backside of the radio and enter it here:

https://gullfoss2.fcc.gov/prod/oet/cf/eas/reports/GenericSearch.cfm

You'll find your answer immediately. This works for any radio you own, of any radio service.

Ryan, Thanks for the reply. I didn't have the radio so I couldn't get the FCC ID. I did find the site below and believe the radio is type accepted for part 90 not 95. I did start looking through the FCC part 95 documents and I only saw where a radio had to meet part 95 spec's not be part 95 accepted. Can someone tell me which rule can clarify(if possible) this for me.

I guess my Maxon handhelds from Radio Shack.com were made before these rules. Even though they are 500mw and 14 FRS channels with PL each has a detachable antenna.

Illegal now like 23 channel CBs?

11975. RE: [GMRS] Lively discussion and question

Yahoo group: GMRS (2005 — 2007)
Date: 2006-10-17 19:23:23 UTC
From: Tom Lasken
Topic: 11897 Message: 11975

Neal,

I was thinking maybe that was amateur radio only. The federal preemption should apply across the board, but GMRS/FRS doesn't have a strong lobby like the ARRL. I thought the ideas was that local govts couldn't object on the basis of aesthetics, just reasonable use for the area. However, as you said, there's room for interpretation. If you want to get into a legal battle over the 100 foot tower, it sounds like you'd win, but that would sure add to the cost of the tower. :)

Subject: RE: [GMRS] Lively discussion and question

Tom
I believe that was for Amateur Radio only
and it was called PRB-1
It wsas generally a guide to say
the local govt should allow a radio amateur to be
allowed the minimum height required to properly
operate
a station. you still had to fight with the Town...
Most local govts set it up so now instead of no
antenna.. they allowed antennas but set a 50 foot
height limit.
thats what my township did.... Big Deal I have
90-110
foot trees.. I wanted a 100 foot free standing tower
so my antennas can clear the Tree tops...
they said my ground elevation was 120 feet I should
still get a signal out at 120 feet ASL Im still in a
valley.

As mentioned, the PRB-1 federal pre-emption is for amateur radio and provides for the reasonable accomodation for antennas and antenna supporting structures by local entities. Keywords are "amateur" and "federal". Quite a few states have statutes that follow along with PRB-1 but not all. To the point, it has no effect upon HOA's. Historical Districts also quite possibly could be exempted from the statute as well, I don't know if they have been challenged.

Bottom line is that in order for PRB-1 to work for you, your tower/mast/antenna/whatever must be for an amateur radio (could co-locate a GMRS antenna on same tower) and a home owner's association has no obligation to follow the rule.

I have seen a couple of instances where 2 or more Repeaters on different frequencies are linked. I do not know what method is being used. Dont care just interested in the legality of this practice. As far as i can see no one has actually received an opinion from the FCC on this comments ??

Thanks SD

True. It has no application whatsoever to deed restrictions such as those relied upon by HOAs. Fortunately, where I live the only constraint I have to worry about is the nearest airport, which is 10 miles away.

Unsure what you mean by this statement. But I understand the first part. 23 or 40 channel CB, they are legal today. Channels 24-40 are extra channels added on later. The 23 channels are the original CB channels. Most radios back then came with a simple squelch, delta switch, and PA switch. Others allowed mods, etc.

Anyhow, I'm off topic. Kinda like the current CB today with all of the illegal mods, but hey, what can the FCC do, huh? Which is why many and most of us are "policing" the GMRS to make sure that it doesn't become another CB service. This also comes from my original arguement a few months and a few years ago, where the FCC should have made GMRS strictly for GMRS, and FRS more for CB-type uses.

The radio you have, is somewhat outdated, and it may or may not be illegal. I don't know. What I do know is that for a FRS-only radio, you can't have a detachable antenna.

Very interesting question. Let me ask my guys over here what they know (from other orgs in the area). I think I wrote about it at one time, but the current rules are not clear. The rules from 1993-95 however, are clear, but they were taken out of service and are not being referenced for the GMRS service under this years rules (2006).

If you'd like, I can do research on the 1993-95 rules and come up with an aswer from them, but again, they won't be current and up to date.

I'll also ask another group I moderate on here. They may have more info...

<>Well you show me where it is allowed, rule number, etc.
I just don't get it. For those of you that want to play, why
you just don't get a ham license where this kind of thing is
legal. As well as I know my name there will come a day
(apparently it will be soon) GMRS will be no better or
even worse then what CB (11 meters) has become. I have
invested several dollars in equipment and I'll be dammed
if the likes of these freaks who are bound and determine
to turn this into a hobby band will ruin it for me, our club
and its members. It already started with putting FRS in
between our frequencies and selling these crap radios in most stores.

What a sad day.....

In the 1998 Rules and Regs of Part 95, I found out that you may link between frequencies. It doesn't say it specifically, because it doesn't mention the word "repeater" in any of the rules. So you have to assume that a repeater is a uncontrolled point or a relay point. With that in mind, the rules back in 1998 had the assumption that you were assigned a specific frequency (or pair of frequencies - 462/467.xxx) to use. If you were licensed for another frequency or pair, then it was allowed to connect to that other frequency under your license.

Today, this does not apply, and thus those rules were dropped. Which is why many of us are confused by them. They don't make sense in their entirety. So you have to trace back to the old rules to see the complete picture. Anyhow, here are the references where I found the answers from 1998's Part 95 Rules and Regs:

95.55, 95.57, 95.59, 95.121, 95.127

Which can be viewed here:

http://www.fcc.gov/Bureaus/Engineering_Technology/Documents/cfr/1998/47cfr95.pdf

It also clearly says that you may not transmit to any amateur radio service, which was interesting... So, if you own both repeater systems, and you are registered to use them under your license, then yes, it can be done. It doesn't say that you can't. But you need to read for yourself to make your own judgement and final decision.

I would just read 1998's version to see what you really do and don't know. You might learn something new that someone in your group doesn't already know!

Can you explain why you think linking repeaters is some sort of
'play'? I'm thinking you're thinking repeater linking is somewhat
experimental, or done for the sake of doing it, not to meet a need.

But it works great and has an FCC type acceptance sticker. I've always used the dummy loads that came with them and will continue to do so until the wife passes her Amateur test soon.

As for 23 channel CBs. This is what I was talking about. I never saw that ban lifted. But like everything else, what's the FCC to do?

Ray and Craig,

If linking repeater stations (systems) together to use them to control an area is your intention, then it is not a good practice and should not be continued. If using them to cover areas where signals can't be reached or heard, then it is a good practice and should be encouraged.

One great example is in my area. I live in the San Francisco Bay Area in California. We have several valleys, mountain ranges, dense areas, and places where the signals either become lost or are choked out by high-tech industry buildings (hence why our area is named the Silicon Valley). To accomplish this task, we have setup systems on one frequency, but with different tone ins and outs. If you're in one area, you can access that system from a certain tone, but every system has either a common output tone or a private output tone.

If we could link systems together, we could also eliminate this problem and the need to use so many tones on one repeater (or group of repeaters - not linked). It would allow our signals to reach areas where cellphone service can't reach; and when in a time of crisis, it would allow us to communicate with our other organizations and groups that we have established, but to use a single system instead of chaos on many systems.

So far, my previous email that I sent with the references that I included (despite the outdated rules), points out that this can be done legally, and it clearly does not say anywhere that you cannot do this.

So why are we still arguing about this, when we don't work for the FCC, we haven't called the FCC for confirmation, or even have a shread of proof that a single rule clearly states that you may not do this (2005 rules & regs)?

is it legal

Ray and Craig,

If linking repeater stations (systems) together to use them to control
an
area is your intention, then it is not a good practice and should not be

continued. If using them to cover areas where signals can't be reached
or heard, then
it is a good practice and should be encouraged.

One great example is in my area. I live in the San Francisco Bay Area in

California. We have several valleys, mountain ranges, dense areas, and
places
where the signals either become lost or are choked out by high-tech
industry
buildings (hence why our area is named the Silicon Valley). To
accomplish this
task, we have setup systems on one frequency, but with different tone
ins and
outs. If you're in one area, you can access that system from a certain
tone, but
every system has either a common output tone or a private output tone.

If we could link systems together, we could also eliminate this problem
and
the need to use so many tones on one repeater (or group of repeaters -
not
linked). It would allow our signals to reach areas where cellphone
service can't
reach; and when in a time of crisis, it would allow us to communicate
with our
other organizations and groups that we have established, but to use a

single
system instead of chaos on many systems.

So far, my previous email that I sent with the references that I
included
(despite the outdated rules), points out that this can be done legally,
and it
clearly does not say anywhere that you cannot do this.

So why are we still arguing about this, when we don't work for the FCC,
we
haven't called the FCC for confirmation, or even have a shread of proof
that a
single rule clearly states that you may not do this (2005 rules & regs)?

its a shame because it is becoming to be the uhf counter part of CB radio. riley hollingsworth gets all these awards for doing what? We see no enforcement being done only run around talk. And yet he says that 75% of all interference is unintentional let's all lighten up shall we?

[kvsp1160@...] wrote:

> Illegal now like 23 channel CBs?
>

Unsure what you mean by this statement. But I understand the first part. 23 or 40 channel CB, they are legal today. Channels 24-40 are extra channels added on later. The 23 channels are the original CB channels. Most radios back then came with a simple squelch, delta switch, and PA switch. Others allowed mods, etc.

Anyhow, I'm off topic. Kinda like the current CB today with all of the illegal mods, but hey, what can the FCC do, huh? Which is why many and most of us are "policing" the GMRS to make sure that it doesn't become another CB service. This also comes from my original arguement a few months and a few years ago, where the FCC should have made GMRS strictly for GMRS, and FRS more for CB-type uses.

The radio you have, is somewhat outdated, and it may or may not be illegal. I don't know. What I do know is that for a FRS-only radio, you can't have a detachable antenna.

11990. Re: [GMRS] GMRS/FRS Confusion - Enforcement

Yahoo group: GMRS (2005 — 2007)
Date: 2006-10-23 11:07:40 UTC
From: kvsp1160@aol.com
Topic: 11990 Message: 11990

I think in terms of enforcement, it depends on the area you live in. Some take their GMRS system seriously, and do protect the service both with actions and enforcement via the FCC and other private organizations. Others just are there to talk to their family at the store, mall, outing, or event. They are only interested in getting the most out of their $80 ticket and want distance; they could probably care less or more if the GMRS was dropped or if someone was interferring with them.

However, with the organizations that do care, we take it very seriously. Many (and most) people don't hear about it because it is best to keep private matters confidential and quiet. At least they are being handled. Some cases can take a few weeks or months, while others may take years to process. This is not entirely all at fault to the FCC. We have to give them some credit for their work. One of many reasons that it takes so long to process a case is because the other party (business, individual, non-licensed, etc.) won't cooperate with the local organizations and with the FCC. Other reasons may be that they/we can't find their contact information or other data to help process the case further. But we do make it happen.

Smaller enforcements, for example, would be neighborhood groups and community efforts that help control the GMRS communications. They can keep track of who is using what radio and frequency in their own neighborhood (block, radius, district, etc.), and if a problem arises, then they can personally take care of that situation. Plus it's a more personal one-on-one relationship between the users and you know exactly who everyone is.

Many people say things but don't do it. When I first started Bay Area Repeater Net, I was highly discouraged because most didn't think I would be able to coordinate with other groups and handle these types of cases and events. But I stuck to it and succeeded. And now I am recognized by most everyone within both GMRS yahoo groups, as well as several big organizations across the state of California. I have also brought organizations back together who didn't know each other existed. And they are excited to be working with my organization as well as each other (and can't wait to meet more). I also get several emails a week with requests for repeater information or repeater access around CA that they can use in their area.

Anything is possible. You just have to know where to look and how to achieve your goals.

Hi

Looks like a bubble pack -->>

http://www.dmartstores.com/cobprgm2wayr.html

See here. It says 5 miles but only 2 watts ERP, real distance 2 miles over fairly clear terrain. More across a valley or open plain and less thru trees and buildings. Atnenna looks fixed to me but hard to say for sure and channels are GMRS and shared FRS 1-7 but not the 467.XXX channels. I wonder why not?

Ah, removeable antenna http://www.energenix.com/cobra-pr900dx.html

must be an older model, nothing on cobra website anymore

But then these reviews are kind of mixed and some one says NOT a removable antenna.

http://www.amazon.com/gp/product/customer-reviews/B00005PJ4V/ref=cm_cr_dp_pt/104-6838600-9427905?ie=UTF8&n=172282&s=electronics

Well, we need the FCCID off one and then we could look it up on the type acceptance website.

Good luck,

No. But adding mods to them are (echo, more power, funny channels, noise makers, etc). Both 23 and 40 ch. versions are legal... including radios that have the 23 channels, but added the rest of the 40 onto them. But this is a GMRS group. Discussions about CB should be offline or at another group.

Back to GMRS...

It was a question this gentleman had, and he wanted to know if it was legal or not and why. Many have stated the fact that it's illegal, but have avoided the repeated questions asking why you think it's illegal. I have proved that this procedure is legal, and even gave you references to look up. Yet you ignore the FCC references and only want to hear from those who think they know what's right, but don't give their answer with refernces or their opinion.

So no, this is not a closed issue. And to further this research on this question, I'll be making a few contacts within the FCC and within other organizations that can give a straightforward and correct answer.

This is not an attack against anyone... I'm just as interested in the answer as anyone here is.

Ryan and the original poster

The linking of GMRS repeaters poses several problems of which mainly deal with the lack of frequencies available and the nature of the service. The problem of monitoring the channels before transmitting arises. What are your gonna use as your link media? You only have a few choices...RF, dedicated wireline, the internet (not to start that argument again), Ma Bell?....we all know the answer to that one.

RF...are you gonna send your link over a 467.XXX channel? If so, best be ready to spend some bucks on extra filtering and/or a combiner. Microwave or other service, cross service...not allowed. Part 15 device...I've wondered about this one myself. Wireline...expensive!!!

Even if the audio transport problem is solved, how are you gonna monitor? You will have to verify that BOTH channels are clear before transmitting. If repeater #2 is 50 miles away from repeater #1 and repeater #2 has a 25 mile radius, how can you monitor repeater #2's output channel 75 miles away? Not a good example, but you get the idea.

Even simulcasting 2 repeaters from the same location has monitoring issues.

Did I miss anything?

Rob, there is a very good reason why there are no GMRS operations or repeaters in Seattle (northern most boundary would be Burien) - and it has to do with FCC regulations. No GMRS operations or repeaters may be set up higher in latitude than a line stretching across the United States beginning at Aberdeen, Washington. It is called the "Line A" boundary, set by treaty with Canada, and includes:

Washington

Treaty definition: The area north of a line from Aberdeen, by great circle arc to the intersection of latitude 48 degrees N, longitude 120 degrees W (near Methow, WA), then along latitude 48 degrees N.

In general: the northern 40% of the state. This includes the following major highways:

I-5 from the Seattle-Tacoma Airport Exit (mile marker 152) north to the US/Canadian border.
I-90 from the Issaquah Exit (mile marker 25) west to its terminus.
I-405 along its entire length around Seattle.
US 2 from Milan northeast to the Washington/Idaho border.
US 97 from the junction of State Highway 17 north to the US/Canadian border.
US 395 from Loon Lake north to the US/Canadian border.

This includes portions or all of the following Washington counties: Chelan, Clallam, Douglas, Ferry, Grays Harbor, Island, Jefferson, King, Kitsap, Mason, Okanogan, Pend Oreille, Pierce, San Juan, Skagit, Snohomish, Spokane, Stevens, Whatcom

The FCC Rules governing use of the General Mobile Radio Service (GMRS) include restrictions (47 CFR 95.45, which also references 47 CFR 1.923 and 1.924)

on the use of certain frequencies by certain classes
of stations when operating "north of Line A" and "east
of Line C" (i.e., near the US/Canadian borders).

The FCC imposes restrictions on most GMRS licenses
that prohibit the licensee from operating his/her
stations north of Line A or east of Line C on certain
GMRS frequencies (primarily: 462.650 MHz, 462.700 MHz,
467.650 MHz, and 467.700 MHz).

Sorry to burst your hopes - but that is what the FCC
rules state. If you wish to research it further, try
this website:

http://www.provide.net/~prsg/line-a.htm

This is a problem without linking as well. I could be 20 miles east of the repeater in my truck, monitor and hear no traffic, key up and stomp all over somone operating simplex on a 462 channel 1 mile west of the repeater.

Linking really just increases the potential.

Ok, so that's two pairs that can not have a repeater north of Line A,
other pairs can be used north of Line A.

Duane wrote:"The FCC imposes restrictions on most GMRS licenses that prohibit the licensee from operating his/her stations north of Line A or east of Line C on certain GMRS frequencies (primarily: 462.650 MHz, 462.700 MHz, 467.650 MHz, and 467.700 MHz).

Shane replied: "Ok, so that's two pairs that can not have a repeater north of Line A, other pairs can be used north of Line A."

I'd strongly recommend making a quick phone call to the FCC office in Bellevue to get a determination on which GMRS frequencies can actually be used in Seattle and north...(north of Line A) it won't cost anything...

From: Duane Vincent
Topic: 12003 Message: 12010

Sane is correct regarding "Line A" frequency use. I checked with the FCC web site, and here is an exact quote:

"GMRS applicants must certify that they will comply with the requirement that use of frequencies 462.650, 467.650, 462.700 and 467.700 MHz is not permitted near the Canadian border North of Line A and East of Line C. These frequencies are used throughout Canada and harmful interference is anticipated."

Super. I learned something... my apologies for any incorrect information that I may have posted.

I have several of these radios and they are on the high end of bubble packs. They DO NOT have detachable antennas as far as any of them I have seen.
I also have two PR1000's which are a bit nicer and DO have a removeable antenna.
Neither are repeater capable.
Both are nice and have decent power and pretty good range.
I like that they are old school 15ch GMRS only.

FCC ID#

Just look at any individual's license.

http://wireless2.fcc.gov/UlsApp/UlsSearch/printAuth_GMRS.jsp?licKey=2486955

It clearly states:
Effective 2/16/99 the GMRS rules have been amended and you may operate
on any of the primary or interstitial channels shown in section 95.29.
Exception: Licensees who operate North of Line A and East of Line C
may not operate on channels 462.650 MHZ, 467.650 MHZ, 462.700 MHZ and
467.700 MHZ unless your previous license authorized such operations.

I operate north of Line A all the time in Northern Minnesota and don't
have a problem.

Hi!

I didn't catch your name, but I was in contact with a guy in Seattle about the same thing awhile back. I travel frequently to the Seattle and Snohomish areas every year, and could use a system as a backup.

From what I am aware of, there aren't any systems currently installed or active. There was one in existance at one point, but the contact I was talking to didn't know of it or hasn't hard from it for a long time.

I suggest making an inquiry at the gmrsrepeater group as well to see if anyone knows about one there. Otherwise, I'd say go for it and I'll be happy to talk to you when I'm up there. If you need any help with setup or building, etc, let me know. I could arrange to give a hand when I'm up there as well.

Stan here
I resemble that remark. As a REACT monitor I listen to CB 9, 19 GMRS .675, FRS 1, MURS (scan all 5) and local ARS repeaters. I am a CERT volunteer and have certificates in NIMS IS-15,22,100,200,317 and 700. Now I am not bragging but I do not believe I would be considered an idiot either.

GMRS is a great radio service. Our team was given a repeater and donated space, feedline and antenna on a 100 foot tower on a fairly high elevation in York County PA. I am excited. But all the above mentioned citizen bands are alive and well where I live. The provincial police in Ontario Canada actually include local REACT teams in AMBER alerts. REACT monitors than pass detailed info to truckers on CB to help in finding vehicles involved, etc.

GMRS is "young" in releative terms. It is underused in some areas, abused in others. It is the job of forums like this one to probe, discuss, dissect, etc all possible legal uses of the service and help it gain its place in the sun. But I think we also need to understand that there are the "idiots" on all bands, I've heard some pretty frightening things on 2m in the few short months I've been a HAM so I don't think any service is immune.

I'm not offended and neither do I mean to cause any offense. I enjoy the banter on the forum. Its healthy. And I still have to post the pics of my Saturn SW1 with the antenna mounting rod I rigged up and all 4 antennae in place, LOL. I get some strange calls, and they come on every band, LOL.

Rob,

The ban is specific to several frequencies used by agencies in Canada but does not include ALL GMRS frequencies nor does it totally ban repeater use. The pairs to not use north of line A or east of line C are: 462.650 and 467.650, 462.700 and 467.700. (http://www.popularwireless.com/gmrstable.html) These limits have to do with preventing harmful interference with our northern neighbors and you can imagine what a 45Watt repeater might do if it was setup in the zone north of line A. However, a small base (less than 5watts ERP and antenna less than 20 feet) is exempt and can be operated in the US north of line A or east of line C without restriction as long as no harmful interfernece is caused. (95.25) This type of station is not likely to be a repeater but rather a neighborhood monitor. But you could easily cover a good deal of territory with 5W ERP 20 feet above your roof.

The simple solution is that you can go to the legal limit if you don't use the frequencies listed above near Canada. Unfortunately Line A cuts diagonally S to N through the Puget Sound area and Seattle is north of the line so the above limits apply. The map can be seen here http://www.fcc.gov/oet/info/maps/canline/canline.gif although it is not very detailed.

Save these emails you are getting back for reference.

Stan

Rob, there is a very good reason why there are no GMRS operations or repeaters in Seattle (northern most boundary would be Burien) - and it has to do with FCC regulations. No GMRS operations or repeaters may be set up higher in latitude than a line stretching across the United States beginning at Aberdeen, Washington. It is called the "Line A" boundary, set by treaty with Canada, and includes:

Washington

Treaty definition: The area north of a line from Aberdeen, by great circle arc to the intersection of latitude 48 degrees N, longitude 120 degrees W (near Methow, WA), then along latitude 48 degrees N.

In general: the northern 40% of the state. This includes the following major highways:

I-5 from the Seattle-Tacoma Airport Exit (mile marker 152) north to the US/Canadian border.
I-90 from the Issaquah Exit (mile marker 25) west to its terminus.
I-405 along its entire length around Seattle.
US 2 from Milan northeast to the Washington/Idaho border.
US 97 from the junction of State Highway 17 north to the US/Canadian border.
US 395 from Loon Lake north to the US/Canadian border.

This includes portions or all of the following Washington counties: Chelan, Clallam, Douglas, Ferry, Grays Harbor, Island, Jefferson, King, Kitsap, Mason, Okanogan, Pend Oreille, Pierce, San Juan, Skagit, Snohomish, Spokane, Stevens, Whatcom

The FCC Rules governing use of the General Mobile Radio Service (GMRS) include restrictions (47 CFR 95.45, which also references 47 CFR 1.923 and 1.924) on the use of certain frequencies by certain classes of stations when operating "north of Line A" and "east of Line C" (i.e., near the US/Canadian borders).

The FCC imposes restrictions on most GMRS licenses that prohibit the licensee from operating his/her stations north of Line A or east of Line C on certain GMRS frequencies (primarily: 462.650 MHz, 462.700 MHz, 467.650 MHz, and 467.700 MHz).

Sorry to burst your hopes - but that is what the FCC rules state. If you wish to research it further, try this website:

http://www.provide.net/~prsg/line-a.htm

>

This is why I highly recommend repeaters use CWID. For those on simplex, they can hear if they're on a repeater output and can expect to be interrupted, whether on purpose or by mistake. Also, even though I don't agree with my own statement, a repeater system does somewhat have priority on the frequency. It depends on what kind/type of traffic is on the repeater (friendly chat or emergency). From this, one can determine if my statement is infact true.

But no, we can't control who we step on. Which is why it is good to have CWID, and it is also good for the users on simplex to monitor that CWID (or any traffic).

...Linking is a good idea, but I'm seeing it as a problem for most unless I/we can figure out a way to control the "stepping on" issue. If both systems were local and private, then it would work. But I just disagree with the whole idea to begin with. Not a good practice. GMRS is meant for short distance two-way communications, while ARS is meant for long distance communications of any kind.

This is a problem without linking as well. I could be 20 miles east of the repeater in my truck, monitor and hear no traffic, key up and stomp all over somone operating simplex on a 462 channel 1 mile west of the repeater.

Linking really just increases the potential.

Nope. That's all I wanted to know. =c)

At least for me, it was an indepth explanation of the why's and why not's that came to our attention. Although I can still see a way for doing this correctly, in other areas it may just as well pose a problem.

Overall, it's chaos, but it's legal. I'm still going to ask around though, as I'm becoming more interested in this subject. Mostly in the ways of RF linking only. Not wireline or IP connections.

Thanks for the answers. 73!

Welcome Rob,

This is a great forum. Stay tuned for (hopefully) answers. Its hard to believe that there are no GMRS systems in a city the size of Seattle but finding them and making contact are the key. If you scan the 8 GMRS channels you may here morse code occassionaly. That's a GMRS repeater IDing itself. If you are a HAM operator and learned code, just jot down the callsign and look it up at the FCC ULS site. If you don't do code you will have to do what I do. I put the radio by the computer and start recording in the PC app of your choice (I have Audacity, its free). Repeaters have to ID on the same time frame as talk (15 minutes) so eventually you will capture the code. Then you will be able to "see" the dits and dahs in the signal on the screen. Use a morse code decode sheet. Then just go to the FCC ULS site and use the license search function. You will get the name and address on the license holder for the repeater. You can write them and find out if they are open to guests or have a little club or whatever. No one is allowed to make a profit but a repeater owner can recover the costs of owning the repeater from users. Somewhere in Seattle there must be a GMRS repeater. There is a REACT Team here http://www.lwreact.com/ but no mention of a GMRS repeater.

Well, again welcome. Time will tell how GMRS will serve you best

12024. Re: Linking of GMRS Repeaters Etc 462.600 + 462.700 is it legal

Yahoo group: GMRS (2005 — 2007)
Date: 2006-10-26 14:56:45 UTC
From: rtoplus
Topic: 11998 Message: 12024

Correct Shane. Linking in GMRS poses substantial issues. GMRS, in my opinion, being a shared service with simplex channels also being repeater outputs compounds the issue. One may argue that amateur allows linking, but with that service, if one follows the band plans for their area, specific frequencies are set aside for the link channel. Also, repeater outputs aren't normally used as simplex channels.

In GMRS, with repeater usage, stepping on someone using simplex 25 miles away is an understood "accepted interference" situation...can't be helped.

Bob, Rowan County ARES EC, GMRS WPVV845, Amateur KG4WAD, LMRS WPXC892

you resemble this remeark??? ?????? what?

[abacuspc@...] wrote:
Stan here
I resemble that remark. As a REACT monitor I listen to CB 9, 19 GMRS .675, FRS 1, MURS (scan all 5) and local ARS repeaters. I am a CERT volunteer and have certificates in NIMS IS-15,22,100,200,317 and 700. Now I am not bragging but I do not believe I would be considered an idiot either.

GMRS is a great radio service. Our team was given a repeater and donated space, feedline and antenna on a 100 foot tower on a fairly high elevation in York County PA. I am excited. But all the above mentioned citizen bands are alive and well where I live. The provincial police in Ontario Canada actually include local REACT teams in AMBER alerts. REACT monitors than pass detailed info to truckers on CB to help in finding vehicles involved, etc.

GMRS is "young" in releative terms. It is underused in some areas, abused in others. It is the job of forums like this one to probe, discuss, dissect, etc all possible legal uses of the service and help it gain its place in the sun. But I think we also need to understand that there are the "idiots" on all bands, I've heard some pretty frightening things on 2m in the few short months I've been a HAM so I don't think any service is immune.

I'm not offended and neither do I mean to cause any offense. I enjoy the banter on the forum. Its healthy. And I still have to post the pics of my Saturn SW1 with the antenna mounting rod I rigged up and all 4 antennae in place, LOL. I get some strange calls, and they come on every band, LOL.

12026. Re: Seattle

Yahoo group: GMRS (2005 — 2007)
Date: 2006-10-26 15:23:05 UTC
From: Rob
Topic: 12003 Message: 12026

Thanks to all for the replies. To answer some of questions and points raised...

1) Yes, I am also a ham operator. My call is N7LX. I do a lot of VHF/UHF and 900 mhz stuff here in Seattle. If you're in the the area, you'll find me on 147.08 most of the time.

2) I am well aware of the Line A restrictions. But as other posts have mentioned, they only preclude operation on .65 and .70. A repeater on any of the other pairs would be legal as defined by Part 95.

3) I've monitored the repeater outputs here in the Puget Sound Area and haven't heard a peep. No Morse IDs. No idle chatter. Nothing.

I'm thinking that due to the hilly terrain here, a repeater on a tall structure with a low ERP would be best. There's nothing worse than hearing the repeater, but not being able to hit it! I'm sure there are GMRS users in the area that would benefit from a decent repeater system. I guess I just need to find them and form a small "repeater users group".

Hi there, I dug this up at http://www.nydxa.info/archive/2004/NYDX06_72k4.pdf

Its old 2004 but maybe OK.

BROOKLYN SHORIM SECURITY PATROLS

A reader recently forwarded us this information

about neighborhood patrols. The information was

posted by "Radio Reporter" on Jim Fordyce's web

site. Sources tell us that "Radio Reporter" is the

infamous and controversial "Bruce" who checks

into our net from time to time!

Boro Park Shomrim Patrol 462.4875(R) 172 DPL

for chit chat, 464 DPL for emergency

Crown Heights Shomrim Patrol

462.3625(R)156.7 for Williamsburg

Boro Park 452.9125(R)172 DPL

Flatbush 461.0875(R) 612 DPL

Also listed: 463.1125(R) 151.4, 464.200(R) 151.4/

103.5, 462.3875(R), 462.2875(R)? 461.750(R)

103.5

5 Ave BID 463.650(R) 723

34th ST Partneership461.150(R) 141.3 Bryant

Park

48th ST BID 461.750(R) 445

Times Sq BID 464.475(R) 445

47 & Bway 464.775(R) 162/025

Assoc for Better NY 478.7625(R) 103.5 Doormen

/ Sec above 59th St , 471.7375(R) 141.3 Doormen /

Sec below 59th St, 471.5875(R) 343 Downtown

Alliance- Wall St area, 477.6625(R) 151.4

Maybe this will get you in the ball park and you can find them.

Its a kind of half hearted half serious joke Jason. I could have been entirely serious and said I resent your remark about only idiots being on CB but I didn't want to be that "heavy" so I used a more lighted humerous version "I resemble that remark" as a way to make my point but remain non-condescending", etc.

I agree with Stan. Besides the channel 17 here in CA that is hogged by a group that claims that it's their channel (using 2kw linears), I also monitor 6 and 19. 9 is non-existent in our area. If you really want help, talk on the local truckers channel as Stan mentioned. Not a empty channel like 9 and hope for the best.

And GMRS is great too, but I get rude people out here as well who need to rethink what they're saying and doing on GMRS.

My two cents.

Hi there,

Yes they are or public service. I did a google search on shomrim patrols and found fascinating stories about the formation of the patrols, early days and now etc. Even some works that appeared fictional involving the Hasids, Shomrim patrols and the NYPD. Very interesting. It may be that they do not want the current freqs public.

The reason being is that a repeater does not have
exclusive use to a frequency pair. Having a repeater
continually id on an output frequency constitutes
"camping out" on a frequency pair. The actions of
which are forbidden.

12035. Re: Linking of GMRS Repeaters Etc 462.600 + 462.700 is it legal

Yahoo group: GMRS (2005 — 2007)
Date: 2006-10-26 23:06:01 UTC
From: rtoplus
Topic: 11998 Message: 12035

In reality, using GMRS for expanded coverage areas could be done in a much easier and practical manner...multiple same frequency repeater sites with slightly overlapping receive receive coverage and a more robust transmitter overlap using different PL tones. Face it, most repeaters can talk better than they can hear and if one has dead spots in a proposed service area, multiple repeaters on the same channel might fit the bill...again, with different PL tones stratically placed.

The only other option would be remote receivers utilizing a central transmitter and a voting system. However, the audio and PTT transport issues are still present in this scenerio. This may be where a part 15 device setup might satisfy FCC scrutiny...maybe not tho too.

Envision a repeater with a 25 mile radius transmit range but with only a 15 mile receive range. Utilizing remote receivers and voting at the central transmitter site could possibly remedy dead spots. This doesn't address the increase in extended total range situation, but it does address the monitoring situation and one's total usable coverage area should be increased. Using a line of sight part 15 device as the link transport media and highly directional yagi, parabola's or corner relector link antennas could be doable.

Again, I'm not sure about the FCC's take on the part 15 useage as far as GMRS is concerned. I do know that some amateurs have experimented with routers and part 15 devices operating under the part 15 rules and then with a few changes, jump into part 97 rules...obviously, this would be dis-allowed with GMRS.

Certainly, there is a possiblilty of interferrence to and from other bonafide part 15 users along the LOS path. A couple of part 15 routers come to mind with external yagis and a good line of sight within each other, one would be amazed at the distance one can achieve with say 250mw of output power back to the central site. Depending on the frequency of the link transport, ERP would have to be very carefully calculated in order to not jump out of the part 15 relm and into another service's area of operation....2400MHz comes to mind cause after ERP reaches a certain threshold, you would now be operating within the amateur rules which is a big no-no.

There was an article in a recent QST magazine where a couple of amateur were experimenting with using part 15 devices under the part 15 rules and got some 15 to 20 mile transmissions. Then upped the power, and operated under part 97 rules, their range increased to some 35 to 40 miles, if memory serves me correctly.

Take a look at the Tessco web site for Last Mile Communications Equipment. Basically, it's designed for broadband internet access and wireless multi line rural telephone access where a local phone company doesn't exist, but you can get a basic understanding of what is and what isn't do'able under part 15 (unlicensed). Of course, they also offer packages with more power and such but those are licensed frequencies and equipment and wouldn't fit the bill for GMRS.

If you remove the antennas on a Linksys router, for example, you'll notice they are connected via a SMA connector. You can also hack (software is freeware and on the internet) the ROM on the router equipment and change the structure of the antennas...one antenna can be for receive only and theother can be for transmit only. You can also increase the output power, but watch out...you can burn out the finals if you're not careful

Cordless phones, LAN operations, and a bunch of other devices operate under part 15 and you would have to have a solution so as not to have someone's home based router or garage door opener keying up your repeater. The technology is there and isn't that difficult, but one must verify that all the "i's" are dotted and the "t's" are crossed and by all means, stay within the part 15 rules.

If I were to undertake a project to fill in gaps in coverage areas, I still think I would go the multi-PL/multi-repeater/same frequency solution. You would be the most "safe" in this mode and the monitoring situation would be a moot point excepting normal monitor before transmission rules.

Just some rambling thoughts.

It seems to me that there was a ruling in the last year or two against
somone who was "Over-ID'ing " (like every 10 minutes) in an area with
a lot of GMRS users.

My repeater ID's every 90 minutes when it's idle and Immediately when
keyed up after being idle. I forget if it ID's more frequently when
it's being used.

The other issue that comes to mind is that when a repeater is on auto ID or beacon mode, there is no way to check for ongoing or emergency transmissions. In other words, the monitor before transmission rule is violated.

If you look through through the PRA's web site, you'll find a NOV from Riley to a GRMS licensee whose repeater was "beaconing" the ID every so-so minutes. The rules state that with the exception of a page, one way transmissions are not allowed which is exactly what an ID without conversation is.

The reason being is that a repeater does not have
exclusive use to a frequency pair. Having a repeater
continually id on an output frequency constitutes
"camping out" on a frequency pair. The actions of
which are forbidden.

I read it as "If your repater ID's continously when there's no traffic in order to prevent or discourage other licensees from using the channel" you better turn it off.

I think it really boils down to what the intent is. They didn't file the complaint because they felt the repeater was mal-functioning and need to be repaird. They did it because this guy was being a bit of a greedy ass.

As we've discussed before, all repeaters have this problem. The repeater doesn't monitor the output ever so there is always the chance that it can stomp on somone elses transmission (simplex or another repeater) because the person keying up the repeater is out of range of the other transmiter.

This is a fact of the shared service.

The complaint agains Hannay was that it was done "coininuously even when there is no traffic on the preater and this is done in order to prevent or discourage other licensees from using the channel."

If you read between the lines, the FCC doesn't mind if your repeater ID's when there is traffic on it.

While it doesn't say how often it was IDing, I'd suspect it was very frequently.

I doubt that if somone filed a complaint that said "Um, yeah, there is this repeater on a channel that's almost always silent (except for some unlicensed activity) that id's itself every hour and a half and when people access the repeater" .... The FCC would say "Thanks, have a nice day."

While it's legally ok to not ID a repeater IF every user identifies, in my opinion, it's not responsible. Your repeater ID is how another user will find you. If you're causing interference on your channel, or worse yet, a public safety frequency, you want to be found quickly.

There's also the issue of unidentified transmissions. If an unlicensed person keys your repeater, or Intermod does, your repeater is breaking the law by not identifying. A fine point, to be sure, but SOMEONE needs to ID every transmission.

Unless someone can cite a rule that clearly shows repeater IDs are illegal, my voice ID stays on the repeater. Remember, just because something isn't required, that doesn't make it illegal.

12045. Re: Linking of GMRS Repeaters Etc 462.600 + 462.700 is it legal

Yahoo group: GMRS (2005 — 2007)
Date: 2006-10-27 17:08:30 UTC
From: Ross
Topic: 12045 Message: 12045

Can anyone tell me how much $$$ a GMRS repeater costs? I am comparing the advantage of using GMRS with our own repeaters to a amateur radio net using repeaters already open around the county.

The disadvantage of amateur radio, especially 2m and 70cm, is that they will be terribly overloaded in a real disaster like one of our infamous southern CA fires or earthquakes. The advantage of ham, as I see it, is that the radios are more powerful and can reach out pretty far on simplex, especially with some of our people living on hills and mountains surrounding the valley.

Would any of you care to comment on this comparison of networks.

Thanks in advance.

Ross

Ray

I can't cite you a rule number, there is none addressing the specific issue of beacon ID's. I can provide a link that lists some NOV's that have been issued and also.
Check out this link:

http://www.popularwireless.com/pra/PRA_beacons.html

It cites several sections of regs, for example no pre-transmission monitoring, being under automatic control, and other items as to why it is not allowed. Also, look into the FCC actions section of the web site and you'll find about 4 or 5 GMRS users receiving NOV's cited for beacon ID's here:

http://www.popularwireless.com/pra/PRA_ENFletters.html

Granted, some of the NOV's had other issues also and I doubt that the FCC is gonna make a special effort to hunt down folks that use ID beacons, but as you can see in the text, the mood of Riley is that it is not allowed.

I agree with you in that if the regs don't say something can or can't be done then one must use his/her own best judgement with the spirit of the regs in mind. I'm just gonna play safe with my systems and truthfully, see no need for auto ID in GMRS.

We may have to agree to disagree.

I agree. The bennefits of a *resonable* ID out-weigh the
disadvatages. And again, I beleive the intent of the repeater
operator comes into play here. If the intent is to piss a bunch of
people off and make them go to a different channel, that's bad.

I don't buy the "You can't have a repeater ID because it doesn't
monitor the output for traffic." Repeaters don't monitor the output
before they transmit ever. Period. It would make them worthless.

Other people have said it's acceptable for a repeater to talk over
somone else in simplex mode because the person keying up the repeater
couldn't hear the simplex party or distant repeater party.

you resemble this remeark??? ?????? what?

[abacuspc@...] wrote:
Stan here
I resemble that remark. As a REACT monitor I listen to CB 9, 19 GMRS .675, FRS 1, MURS (scan all 5) and local ARS repeaters. I am a CERT volunteer and have certificates in NIMS IS-15,22,100,200,317 and 700. Now I am not bragging but I do not believe I would be considered an idiot either.

GMRS is a great radio service. Our team was given a repeater and donated space, feedline and antenna on a 100 foot tower on a fairly high elevation in York County PA. I am excited. But all the above mentioned citizen bands are alive and well where I live. The provincial police in Ontario Canada actually include local REACT teams in AMBER alerts. REACT monitors than pass detailed info to truckers on CB to help in finding vehicles involved, etc.

GMRS is "young" in releative terms. It is underused in some areas, abused in others. It is the job of forums like this one to probe, discuss, dissect, etc all possible legal uses of the service and help it gain its place in the sun. But I think we also need to understand that there are the "idiots" on all bands, I've heard some pretty frightening things on 2m in the few short months I've been a HAM so I don't think any service is immune.

I'm not offended and neither do I mean to cause any offense. I enjoy the banter on the forum. Its healthy. And I still have to post the pics of my Saturn SW1 with the antenna mounting rod I rigged up and all 4 antennae in place, LOL. I get some strange calls, and they come on every band, LOL.

Can anyone tell me how much $$$ a GMRS repeater costs?

Hi Ross,

Our system was built from scratch, and only cost us just over $600 for everything (repeater, coax, tower, antenna, etc). For a new factory-built repeater system (Motorola, Yaesu, Kenwood, Icom, etc), they start at around $800 and go up. Then you'd need to buy your coax, antenna, tower, and other accessories.

From my experience, with a new system, if anything needs to be repaired, you have to send it back to your dealer or the manufacturer. With a scratch-built system, you can repair, add, or change the components yourself, and it won't cost you more than a few dollars (vs $$$). You know exactly what's wrong with it because you built it.

Would any of you care to comment on this comparison of networks.

I think in terms of emergency vs normal traffic, it would vary from area/city/state, etc... It depends on how much that system is used. Yes, the ARS is better to use in both emergency and normal traffic, but so is GMRS. For repeater systems, I think the ARS has the advantage, because you can do so much more with ARS when you communicate. GMRS has the advantage for simplex. Although you can't talk farther in simplex like ARS can, you can talk to those using bubblepacks, and those who have families (who don't have an ARS license), and they can relay ther needs back to you in times of need. GMRS allows more power for simplex, so if you can reach out to others by using a 50w simplex unit, and receive using a pre-amp, you have the advantage for families across the area/city/state, etc.

Already in most cities, your city hall emergency office has a communications room setup for such activities with equipment being put on standby. Most of that equipment are those for Fire, Police, EMT, Hospital, ARS, and other radio systems. But few have GMRS stations setup, because they are unaware of the need for one. They think that REACT will handle it, or that the ARS can do the job. So what about those families with bubblepacks? What category do they fall under if GMRS isn't a part of your city hall emergency comm office?

This would be a great chance to put those annoying bubblepacks to use, and setup a GMRS system for the interstitial freqs as well as on .675. Who says you can't? This idea may just save one more family in that time of need...

Very well stated.

There is "the letter of the law" and "the spirit of the law" and that
frequently leads to individual opinions.

People can always disagree with each other and still get along :)

If you are using a duplexer, you will have to retune
each time you change the channel pair, to get optimum
use.

You might squeak by going just one jump, but it won't
be as good.

Clint

That is one of the rule violations caused by beacon ID'ers that I've
been trying to point out. That rule violation, amoung others, such
as no pre-transmission monitoring, potentially not yielding to
emergency traffic, etc, back my stand on this and is the crux of the
discussion.

Sure it makes a difference. That's the very point...a GMRS repeater is not supposed to transmit on it's own, that's automatic control and not allowed (there is a rule about that)...it must have a control operator telling it to transmit.

Your handheld, mobile, base is receiving on the simplex channel (and repeater output) and if you un-PL your radio and listen before your transmit, or run open squelch like I do, you are complying with the rules.

No, you can't hear a bubble pack simplex conversation going on 25 miles away from your high profile repeater, and your repeater might walk all over them. You are not responsible in that case. If you make an attempt to monitor traffic and hear none, then talk away.

I have now determined it is not in my house. And I did not have to use an elimination technique. I forgot I can tune my HAM rig to FRS freqs. Now I am on my base antenna and this "dead key" it is in a building, a room with kids and adults talking like a party. But one man is specifically greeting people and asking quetions, "Where are you from?" and people are responding so it is not a neighborhood party among friends. Some of the people are strangers. At first it sounded like a preacher delivering a sermon, then this hubbub as if the service ended and a social started. Anyway, its close giving me 5-8 on my signal strength. Its a foul night so I am not inclined to go "trackin" tonight but as this TXer is always on, I can now take the HAM rig with signal strength meter and ride in comfort in the car. They have some sort of open mike monitor on FRS 4 no tone. This has got to be illegal and probably not intentional in terms of someone thinking they are messing up other people's TX but rather a case of ignornace. A friendly rehearsal of FCC rules should stop the problem.

It's legal, but it would drive your users up the wall.

Personally, I don't know why you'd want to move off of your crrent frequency and CTCSS (PL) due to interferrence caused by other users. It would allow them to think that they accomplished their goal and then try to find your repeater elsewhere and pursue the problems again, or move onto another system and cause chaos there.

If you stay with your current freq and CTCSS, and ignore the misusing users, they will eventually go away. You can always track them down by using a yagi antenna, a signal strength meter, and the output frequency that you hear them on (since he's on your repeater, monitor your input freq - 467.xxx). Then make a starting point on the map and pinpoint them using a triangle method. When the lines intersect on the map, that's where the user is causing the trouble (approx). To pinpoint the area further, remap the pinpointed area, and redo the same methods til you find him.

It does help to listen also to any background noise or to catch any hints as to where he is. But never give up and move off of your frequency becuase of a small issue. Change CTCSS if need be. See my website under the Repeater Guide for more info, or contact me on the side for more help.

Ok, I (the control operator) told it to ID every 90 minutes, just like
I (the control operator) told it to re-transmit received signals (with
the correct input frequencey and PL) immediately when it hears them.

I understand your point. The rules say you have to have an operator, etc.
(For clarity, which rule states that NO automatic control is allowed.)

So, we are aruging over what the definiation of automatic is and how
it relates to repeaters in GMRS.

Even the PRSG states:
"A repeater station is a special kind of base station that receives
signals on one frequency (in the 467 MHz band), and automatically (and
usually, nearly simultaneously) retransmits that signal on another
frequency (in the 462 MHz band). "

You have to admit, a repeater is inherently automatic unless there is
somone phyiscally (there or remotely) pressing the PTT when there is
an incoming signal.

In the rules:
(d) The station identification must be transmitted in:
(1) Voice in the English language; or
(2) International Morse code telegraphy.
(e) A station need not identify its transmissions if it automatically
retransmits communications from another station which are properly
identified.
==========
What makes this a dificult subject is the rules don't say "A station
MUST NOT" identify if it automatically retransmits communications from
another station which are properly identified.

You could read that to say "a repeater MUST identify any un-identified
transmissions." (ie: intermod, kerchunkers, etc)

Addtionally, the fact that International Morse code telegraphy is
permitted as station identification gives us a hint that this might be
ok.

If GMRS existed in a world with no other two-way communications existed and nobody ever heard of repeaters that ID's themselves automatically, I'd probably have a different opinion.

If the NOV's that have been issued were only because people were ID'ing regularly (and not to intimidate other users) then I might have a different opinion.

I agree with that as well. A repeater will ignore anything on the output. A fully licensed legally operating mobile on the same frequency as my repeater, sitting underneath my repeater talking to another repeater that I can't here will get walked on.

the only problem when you build it is not type 95 approved with the FCC and it may come back and get you. We had the FCC here at one time check all the repeaters at a tower site to make sure they were all type approved for there use. Any that was not could not stay. HAM does not have to be, it is part of the building part of ham radio.

12065. Repeater Controllers

Yahoo group: GMRS (2005 — 2007)
Date: 2006-10-30 03:06:28 UTC
From: Ray_Vaughan_99
Topic: 12003 Message: 12065

I use this one:

http://nhrc.net/nhrc-2/

It's a great project. If you build it I think it's less than $70. Easy to build if you've ever used a soldering iron. And since it doesn't in any way effect the RF sections of the radio, it in no way effects the FCC certification of the repeater. I use the same model in ham, GMRS and LMR systems.

Note that the ID is smart. It doesn't ID unless there has been usage in the last x minutes. It's not set to beacon. It might be an option, but I don't use it that way in any of the services.

Ray

In a message dated 10/27/06 5:33:31 PM, dzrtram@... writes:

Can anyone tell me how much $$$ a GMRS repeater costs?

Hi Ross,

Our system was built from scratch, and only cost us just over $600 for everything (repeater, coax, tower, antenna, etc). For a new factory-built repeater system (Motorola, Yaesu, Kenwood, Icom, etc), they start at around $800 and go up. Then you'd need to buy your coax, antenna, tower, and other accessories.

From my experience, with a new system, if anything needs to be repaired, you have to send it back to your dealer or the manufacturer. With a scratch-built system, you can repair, add, or change the components yourself, and it won't cost you more than a few dollars (vs $$$). You know exactly what's wrong with it because you built it.

Would any of you care to comment on this comparison of networks.

I think in terms of emergency vs normal traffic, it would vary from area/city/state, etc... It depends on how much that system is used. Yes, the ARS is better to use in both emergency and normal traffic, but so is GMRS. For repeater systems, I think the ARS has the advantage, because you can do so much more with ARS when you communicate. GMRS has the advantage for simplex. Although you can't talk farther in simplex like ARS can, you can talk to those using bubblepacks, and those who have families (who don't have an ARS license), and they can relay ther needs back to you in times of need. GMRS allows more power for simplex, so if you can reach out to others by using a 50w simplex unit, and receive using a pre-amp, you have the advantage for families across the area/city/state, etc.

Already in most cities, your city hall emergency office has a communications room setup for such activities with equipment being put on standby. Most of that equipment are those for Fire, Police, EMT, Hospital, ARS, and other radio systems. But few have GMRS stations setup, because they are unaware of the need for one. They think that REACT will handle it, or that the ARS can do the job. So what about those families with bubblepacks? What category do they fall

under if GMRS isn't a part of your city hall emergency comm office?

This would be a great chance to put those annoying bubblepacks to use, and setup a GMRS system for the interstitial freqs as well as on .675. Who says you can't? This idea may just save one more family in that time of need...

I didn't say "solder and component" from scratch... Every piece of equipment in my repeater system is certified for both 90 and 95; and the transmitter is certified for both 90 and 95, as well as for other radio services (80, I think).

It's one thing to use a HT or mobile unit that is or is not Part 95 certified for GMRS, but to put a repeater system in use that is not certified under Part 95 for GMRS... That is not a wise practice.

Probably misunderstood my posting, and I should have been more clear. No worries.

12069. Repeater ID

Yahoo group: GMRS (2005 — 2007)
Date: 2006-10-30 16:13:47 UTC
From: Ray_Vaughan_99
Topic: 12003 Message: 12069

Excellent question. Here's why:

"Sec. 95.119 Station identification.

(a) Except as provided in paragraph (e), every GMRS station must
transmit a station identification:
(1) Following the transmission of communications or a series of
communications; and ... "

Then note:

" (e) A station need not identify its transmissions if it
automatically retransmits communications from another station which
are properly identified."

As the owner of the repeater, I can not guarantee every transmission
that goes through my repeater is properly identified. So I have to ID
to avoid violation of (a)(1). Note that (e) clearly says 'need not'
not 'MAY not'. It is clearly optional and I take the option to ID to
avoid violations.

I get it. A station must identify itself AFTER A SERIES OF COMMUNICATIONS.
So why not set the morse code gizmo to go off ONLY after the repeater has been kicked and then only once in 15 minutes or so. To me, that would be far more courteous to the rest of the radio community out there.

From: kvsp1160@aol.com
Topic: 12072 Message: 12072

You're welcome Stan. They're ideas for life, but all it takes is someone to make that change.

Unfortunately, I chose to own three businesses (two recording studios and BARN), plus a side job as a FOH Audio Engineer... so it limits my time that I have to venture out into that area. What I do have time for, is to build the relationships between the organizations and groups that surround ours as well as others in the area and state. This way we all can be a part of one team when we have a crisis or major emergency. I'm also looking into reorganizing parts of the coordination efforts from our current repeater systems, and encourage others to build more where they are needed in the state.

The ARS has a wide coverage, but GMRS has a small coverage. I'll be filling in part of that gap as I look into some of our new repeater sites coming in for 2007.

Linking? Probably not. But definately sharing of systems is a great tool to have, and building systems to cover an entire metro area (or more) is a better idea than having several smaller systems cluttered in the same general area. To be organized is part of what GMRS needs. Almost like how the ARS has the ARRL, but focused on a specific area or state.

There are also systems that are camping on frequencies with expired callsigns (beacon CWID), as well as businesses using GMRS frequencies without proper licensing (should move to business band).

So alot to do... If anyone wants to lend a hand (if they're living in the area), feel free to contact me.

12073. Re: Repeater ID

Yahoo group: GMRS (2005 — 2007)
Date: 2006-10-30 22:29:17 UTC
From: Ray_Vaughan_99
Topic: 12003 Message: 12073

I think that's how most ID'ers work unless forced into a beacon-like mode. From the controller I like: http://nhrc.net/nhrc-2/picrpt.php Note the last two sentences. For GMRS, change the value from 600 to 900 seconds for the 15 minute interval.

Repeater Controller Mode

The controller has an ID timer which can trigger 1 of 2 stored voice IDs, or the CW ID. The IDs are controlled by a user-programmable ID timer, which can be set from 10 seconds to 2550 seconds. Normally this will be set to a value less than 600 seconds (the FCC-mandated 10 minute ID time.) The controller will play the "initial ID" if it has been quiet for one entire ID cycle (that is, the time specified by the ID timer has elapsed since the repeater's last transmission.) The initial ID might contain a message such as "Welcome to N1KDO repeater." The "normal ID" will play after the ID timer expires. The normal ID would typically contain a short ID message like "N1KDO repeater." The controller tries to be "polite" about when it IDs; if a user unkeys and the ID timer has 60 seconds or less remaining before playing an ID message, the controller will ID immediately in an attempt to keep the ID from playing on top of another user. If a user keys up while a stored voice ID is playing, the controller will cancel the stored voice ID and play the CW id. Also, if a user keys the repeater, and the controller plays the initial ID, the controller will not play the normal ID after the ID timer expires unless the repeater is keyed again. This prevents unnecessary IDing by the repeater.

12074. FRS and GMRS radio recommendation and question

Yahoo group: GMRS (2005 — 2007)
Date: 2006-10-31 13:26:05 UTC
From: marty398
Topic: 12074 Message: 12074

I need to have both FRS and GMRS capabilities but probably won't have a need for great range. I don't want to carry two radios. Currently I don't think there are any repeaters in my area (Bellevue and Omaha, NE), so I don't need my radio to be repeater capable. I would prefer it to have a weather radio and severe weather alert.

Are there any radios other than cheap bubble packs to choose from that can (legally) use all the FRS and GMRS channels?

Also, why do the ranges claimed vary so much even for radios by the same manufacturer with the same power output? Examples: The Motorola T7400 claims to be a 12 mile radio with 2 watts, but the 7200 (which is repeater capable) claims only 5 miles and also has 2 watts. Other 1 watt Talkabouts claim 5, 8, or 10 mile ranges.

Is there a good way to choose?

Any recommendations?

Marty

Ray

I'm gonna have to dis-agree with you on this. Unlike amateur service, a repeater in GMRS is not considered an extension of the owner or trustee. That's one reason ARS repeaters must ID and GMRS repeaters don't have to.

A repeater ID does NOT relieve it's users from ID'ing themselves even if the repeater ID belongs to one of the talkers. A repeater ID is not a substitute for a user ID'ing himself. You could be creative and install a CWID board in your base radio that ID's your call in CW every 15 when in use. That would be valid.

Amateur radio...repeater must ID, GMRS....repeater ID is optional, regardless of who the user's are. The rule you quote relates to users conversing whom are operating under the same license. For example, me (the licensee) talking with my sister (under my license) and my nephiew (who also is operating under my license) talking via Joe Blow's repeater. As long as one of us 3 ID every 15 and at the end, all is good.

From: Ray_Vaughan_99
Topic: 12003 Message: 12077

I don't think anyone said that a repeater ID replaces the call sign for users.

If I take your comment right, are you saying a GMRS repeater could be put on the air without any license? Could anyone put up a repeater without being a GMRS licensee? Or am I taking your comment too far?

The rule I cited applies to all GMRS licensees. Family, grand fathered business, same licensee, multiple. When you say "As long as one of us 3 ID every 15 and at the end, all is good" I don't think that's supported by the rules unless you can quote something I missed. To me "every GMRS station" doesn't mean one of 3.

No problem at all about disagreeing with me... That's what keeps it interesting. Just please cite rules to back up your opinion.

Thanks

12078. Repeater ID

Yahoo group: GMRS (2005 — 2007)
Date: 2006-10-31 17:53:46 UTC
From: Craig
Topic: 12003 Message: 12078

Not so difficult. Our repeater(s) will only ID if
there is activity. If no one keys up in 24 hours
you don't hear a thing from the repeater. When
there is activity, it will ID in 15 minutes intervals
or however the controller is set.....

From: Walters
Topic: 12074 Message: 12079

Hi Marty,

I know that purists might put down the "bubble pack" radio. If you want all the FRS channels you cannot have a removeable antenna. Therefore you will be buying a "bubble pack". However, that said there are some pretty nice ones out there. Go for the actual power rating, as you have seen the manufacturers inflate the distance by as much as 3-4 times the power in watts. The general rule is 1 mile for each watt, then your range doubles every time you get three times higher. The 1 mile per watt rule is for ideal terrain conditions. Being inside a car cuts down the range. But UHF is very line-of-sight, so if you can see the antenna you can talk to it.

Our REACT Team needed an entry level non-repeater capable radio for new members. We decided on the Midland GXT600. You can get them in black or camo and in a complete kit with 2 radios, rechargeable batteries, drop in charger and headsets for $70.00. They are 5 watts (not ERP, that is less) and most reviews were positive. You need the GMRS license and they have weather channels with an alert function. Do some research as new models are always coming out.

Good luck and happy TXing,

As Stan already said, you will need a radio with a permanently attached antenna. This points to bubble packs. Also your desire for a weather radio says bubble pack.

>
> Are there any radios other than cheap bubble packs to choose from that
> can (legally) use all the FRS and GMRS channels?

Yes, expensive bubble packs :)

Actually I think there may be a Kenwood model with a permanently attached antenna, but with better construction than a bubble pack. Hopefully someone with better knowledge of Kenwood models can speak on this...

> 1 watt Talkabouts claim 5, 8, or 10 mile ranges.

Because marketing people are big fat liars! The power ratings are lies. The mile clains are lies. In order to get the real truth on transmit power you need to get the FCC ID of the radio (on the back of the radio) and look up the test reports that were submitted for FCC approval of the radio. What you will find is that most of the radios put out nowhere near the advertised power, and that the manufacturer knew it!

For example, this is one I happen to know.. the Motorola T7200.. which happens to be one of the better bubble packs, has an actual, tested ERP of 1.75W, fairly close to the promised 2W. And it has a decent receiver, so maybe, if you are going from hilltop to hilltop on a prairie in the middle of nowhere, you will get the promised 5 miles. To a decent repeater you will definitely get 5 miles, probably more.

These others I am going by memory, because I don't have the reports anymore.. But the T7400, also promises 2 watts.. but 12 miles! Which is a joke. But when I looked at the FCC report, the 7400 put out LESS actual ERP than the 7200. Sorry I don't remember how much less, but significantly less.

The SX700R, the most commonly sold Motorola model right now, so far as I've seen, also promised 2 watts and 12 miles. Well, according to the FCC report, the ERP is 0.75W.. that's right, 3/4th of a watt! And I can tell you from experience that their range is not very good. They are small, and they are cheap. They sound decent. They have cool features. But lots of range, forget it.

We used to use a pair of the T7200 and I was pretty happy with them. Good sound, fairly decent range (the receiver is decent for a bubble, which makes as much if not more difference in terms of the range you will get as the transmitter). Unfortunately, this past spring one of the T7200 went missing, so I went on the hunt for new bubbles. That is when I tried the SX700R's.. for a camping trip. Would not suggest those to anyone unless they are within a short range, much less than a mile.

The brands finally narrowed down to was older Motorola, before they were made by the awful company that makes them now.. in other words, a second hand T7200. Or Midland. Or an older Cobra. Midland seems to have higher actual (ERP) power compared to many of the others, but I didn't find too much actual praise for them.. as I said there is more to range and performance than just the transmit power. Receiver sensitivity and audio quality are important too. I found a lot of praise for the old Cobra PR4000, which is discontinued. It promises 3 watts and actual ERP is 2.25 watts, which was good enough for me, it was at least as much power as I had been happy with on the T7200. I found the radios second hand and they worked out very well. Very well made for a bubble, fairly good performance (for a bubble), the outstanding thing about them was the battery life, we had them out in the wild for 10 days, left on almost all the time (though usually just standing by) and only changed batteries once, and that was almost the end of the trip that we changed them. So those were pretty good as bubbles go. And they do have the weather radio. Also an electronic compass that works fairly well in a pinch, and a clock which is a bit of a pain, but it is a working clock.. nice bonus to have if you are in the middle of nowhere.. you lose your regular timepiece, you have the radio.

I think the Midlands probably would have worked out well also, I do hear sporadic praise of them (and when I say praise, I mean credible praise from someone with high standards, not praise from someone talking one end of the mall to the other who is thrilled it works at all). The ERP (actual, from the reports) were reasonably close to the claimed power, which says you are dealing with a manufacturer of some integrity.

In any case I would suggest that any radio you consider, you try to get the FCC ID of it, and then that can be looked up online and you will get the true transmit power of it. The URL to do the lookup is posted here once in a while, but I don't have it... Hopefully someone else can post it. The ERP doesn't tell the whole story but it does give you an idea.

From: rtoplus
Topic: 12003 Message: 12081

Ray

I've been a licensee since about 1978 except for a lapse from 87 until my current license grant...2002. I was either KLT6478 or KA25583 or KIE something...I can't remember. I had several licenses at that time as I do now.

I was licensed under GMRS when it was known as Class A Citizens Radio. Point to this, besides admitting to my age...LOL...is I think I may have been remembering the old rules, for example, when only 1 channel pair was issued normally and one couldn't talk with other GMRS licensees. After looking through the current rules, I think you may be right...that all 3 family members in my example, although it would be really clunky and redundant, should identify. I think this might be splitting hairs tho.

I can't find anything in the rules that stipulates that communications occurring within a single license "group" need to re-ID as long as one of the parties ID's. (I didn't word that quite right, but I think you get the picture.) Can you imagine a grandfather'd business...a gravel hauling company with a dispatcher, having his drivers ID along with the dispatcher? Doubt it would happen.

I'd like to see a FCC statement on this, that if the licensee (or his family member) properly ID's at the proper intervals, are the other members with whom the conversation is taking place (assuming no outside people are involved in the conversation), required to ID also.

As to your other statement about repeater ownership, used to be, yes, a repeater could be owned by a non-licensee, but under the new rules I don't think so. Take look at this:

Sec. 95.33 Cooperative use of radio stations in the GMRS.

(a) Licensees (a licensee is the entity to which the license is issued) of radio stations in the GMRS may share the use of their stations with other entities eligible in the GMRS, subject to the following conditions and limitations.
(1) The station to be shared must be individually owned by the licensee, jointly owned by the participants and the licensee, leased individually by the licensee, or leased jointly by the participants and the licensee.

By the very wording of this rule, a station would be totally shared if the owner was not licensed...assuming that the owner allowed

people to use the repeater. Sub section 1 would be violated if this took place, in my opinion. Again, this change came with the re-writing of the rules dis-allowing a non-individual to be licensed. A business, for example, could be licensed, have a repeater, and the repeater owned by an employee of the business even tho the employee wasn't personally licensed.

Another example (not a true story). I have a friend who is not GMRS licensed. He owns a tall building down town. He has his ham license and operates a 2 meter repeater on top of his building. He has an extra Part 95 certificated repeater of which he has no plans to use at the present. He programs it up and installs it on top of his building for me and the GMRS community to use. Is this legal? Food for thought.

I do know of several folks that do have GMRS repeaters in sevice and they themselves are NOT licensed. They are not grandfatherd businesses, they are individuals. Would the FCC go after them, I doubt it unless the FCC had other issues with the person besides this one.

Bottom line, is now, no, I don't think a repeater can be placed in service by a non-licensee.

A lot changed with the rules re-write and as usual, the do's and don'ts are as clear as a pot of day old coffee.

There's a great way to resolve this, and I've seen it done and have been agreed upon on this group before.

Bob: When you talk to your sister and nephew, you probably say "This is WPVV845" and then go ahead and talk with your party. That's great to announce who's on the air, but to others monitoring the frequency, they may not know that you are talking to family and will assume that the others are unlicensed. To correct this situation, you can create handles (the same type used on CB and in most REACT groups) for you and your family to use. Use alpha characters and/or numeric characters to your handles, so it becomes something like this: "This is WPVV845, User01. Calling User 27 and User 32." In this way, others will now have the understanding that the other people in your communicating party are operating under your license. And when you clear the frequency, Always have someone use your callsign at the end (not multiple times).

I used the same thing when I owned a CB radio group here in California back when. Instead of using crazy handles, we used expired callsigns from the original CB Class D licensing: KPBZ2117, KPBZ2125, KPBZ2149, etc. Every callsign had a "KPBZ21xx" and the user would fill in their own personal two-digit user ID on the end of every callsign. We all knew who we were, and where we were as well. (BTW, we still have users that use the above callsigns when on CB. So you can't take them to use, nor the character combination. Use your own...)

Anyhow, that's my two cents for now... 73!

Very well stated.

There is "the letter of the law" and "the spirit of the law" and that
frequently leads to individual opinions.

People can always disagree with each other and still get along :)

I'm still waffling on whether or not to put up a repeater.
I know it would be beneficial to portables talking to each other, but I just don't have the need for that very often.
I'm digging through the rules right now. Am I allowed to use more than 5 watts on my base station? What if I want more than a "small base station" in my system? Can a repeater transmit with more than 5 watts?

Thanks,
Danny Harmon

From: kvsp1160@aol.com
Topic: 12003 Message: 12090

Danny,

A base radio, mobile radio, or a HT radio can transmit up to 50 watts TPO (transmitting power output). A repeater can transmit up to 50 watts TPO as well.

A small base station may transmit up to 5 watts TPO.

A fixed station must transmit with no more than 15 watts TPO.

A small control station at a point North of Line A or East of Line C must transmit with no more than 5 watts ERP.

The above came from Part 95.135
http://a257.g.akamaitech.net/7/257/2422/09nov20051500/edocket.access.gpo.gov/cfr_2005/octqtr/47cfr95.135.htm

So to answer your question/confusion, your repeater (or any repeater system) may transmit up to 50 watts TPO, and your base, mobile or HT radio may also transmit up to 50 watts TPO.

A base radio is very different than a base station. What you have is a base radio, and are able to talk on any GMRS frequency (simplex or duplex) and tone, and are not required to have a seperate license with the FCC or keep it in a single fixed loction.

Today, GMRS doesn't see very many base radios, if any at all. Most people talk on mobile or HT radios. If a base radio is used, it's likely already converted into a repeater system or used as a backup at home or in the shop. They require so much power and amps that it gives off alot of heat and is not worth it to be left on for a great deal of time to use on a day-to-day basis. Mobile and HT radios can be left on for days on end without burning up or using all of that extra power. And they are much easier to program as you don't need to change out crystals or tone panels.

My GE Executive II base radio here at home tends to give off alot of heat. Especially when in the case. So I decided to switch to mobile and HT use and put the Exec II to work as a repeater with fans on the amps to cool it off.

Anyhow, kinda went off the subject there, but gives you an idea of what's what. Hope it helped...

Hi Danny,

If you can believe it, you have a converted mobile-to-base station. However, according to the FCC, it would be still considered as a mobile radio or a base radio.

My understanding is, a small base station and a fixed station at one time had to be registered with the FCC under it's own license and you had to notify the FCC of what frequency you wanted to use, etc. Since those rules are no longer in service, and the Class A CB became today's GMRS, we don't have to register frequencies or notify the FCC of these details.

Also, many radios being made in today's market are mostly mobile and HT radios for the Land Mobile Radio Service, the Business Radio Service, and other minor radio services that don't need such a big base setup or operation.

FYI... If this doesn't answer your question in full, others in this group can get really technical with the who's and what's on base vs fixed. I only stick to the basics and repeater-related stuff in general. But I'll do my best to help in any way that I can.

Hmmmm? I just checked the calender and it isnt April
1st.

The Icom 7800 could be modded for GMRS/FRS, but it is
not type accepted for those bands. Plus do you really
want to spend $10,000 on a radio for GMRS/FRS?

That pretty much answers it, Ryan. So since I'm running a GM300 on the base and a CM300 mobile, I should not have to worry about the "small base station" and "fixed station" requirements.
Many thanks for the info!!

Regards,
Danny Harmon

but once again to the correct answer - you cannot use
the ic-7800 to legally transmit on the GMRS/FRS freqs.
It is not certified for use on the frequencies. The
transmit output requirements are not the same as for
ARS.

Hi there,

First, you need a GMRS license. Then everyone not a member of your family needs their own GMRS license unless you are using FRS channels at .5Watts. Then FRS rules apply. If you use FRS 1-7 then licensed ops can run higher power and still talk to the unlicensed ones.

As far as mag mounts go, yes they will make a difference. Transmitting from a radio inside the metal skin of the car will cut back on effective range. External roof mounted mag mounts will get all your TX energy out in the open and improve your range between vehicles. Try to use as few adapters as possible as these create loss in the feedline.

It has been said here before, but getting the radio is easy. EVERYTHING hangs on the feed line and the antenna. A 5/8 wave has a better TX pattern and gain over other designs. Use a good low loss cable. Finally remeber that GMRS freqs are "line-of'site" regardless of power out.

Good luck with your day on the move.

Maxrad and Radiall/Larsen come to mind. Check out
rkleef.com for other antennas and pricing.

Also if antenna is quarter wave length for 440-450,
you can cut it down for GMRS band. No easy but with a
sturdy pair of diagonal cutters.

Wow, what a wide open set of questions, but all good ones. You should get lots of responses.

Well, lets see, what's the comotion about? Well, you know about CB, its AM, noisey, a relatively few make it not so nice for the rest occasionally. Popularity of CB kind of waxes and wains among the masses. Its real devotees never leave it.

GMRS has been around under various names and rules for a long time. It is only now coming into its own as the rules make it more friendly. Its FM, uses PL tones for quieting, kind of a little brother to 70cm HAM (my opinion) and still requires an $80 fee so the masses are not swamping it. Read this group and you will see that unlicensed users from the FRS service are the biggest problem maybe. Unlike its little cousin, FRS, GMRS is allowed 50 watts output power rather than .5 watts, big difference. But even bigger is the antenna restriction. GMRS is allowed external antennae for example mobile, base and repeater use. FRS radios cannot have removable antennae. This means that you can benefit from the height advantage of a roof mount and more importantly a tower for a repeater. No telephone patches are allowed at this time.

Some people go all the way and build systems for use to cover a certain geography. Although business are not issued licenses, there is no restriction on what you use the communications for. So you can conduct any personal or business related comms you want within the FCC rules. Others join together as coops of repeaters for their mutual benefit. You are not allowed to operate a repeater as a profit making venture but people who share a repeater can ditribute the burden of rent, maintenance etc among the group. There are several repeater coops you can read about on the net. BARNS in CA and LAG in WI, IL, MI, MN and IN.

This is Lakes Area GMRS Repeater Group (LAG) http://eebie38.tripod.com/gmrs/index.html

This is Bay Area Repeater Net (BARN) (I can't find the site but Ryan can get you there)

Freqs are 462.550, .575, .600, .625, .650, .675, .700, .725. The repeater offset is +5MHz

As far as radios go you will find simplex only bubble packs, GMRS repeater capable HTs, professional grade radios requiring computer programming, mobile units and repeaters. I have not seen any 45W GMRS base stations but they could be out there. Most folks just use a mobile with a 12VDC power supply.

Well, its taken me all day to compose this and I have not read any other responses so here is my two cents worth.

Good luck,

I replied to your inquiry below...

> OK I know nothing of it so could anybody tell me more about it.
> I have ben an avid C.B.er for over 30 years and have talked arround
> the world in that time.
>
- I've been on the 11m AM and SSB for a while too. If you're ever in the SF bay area, give me a shout on 6. Most know me as "88".

> Whot is it about GMRS that has people stured upand how easy is it
> to get into.
>
- Not sure what you mean by "stirred up", but alot of people and radio comm groups do use GMRS. All it takes is for you to fill out some info and send it in to the FCC along with $80. That will get you your 5-year license that will c over you and your entire family. No tests, no codes to memorize. Very simple and easy. The next step is to get a nice radio system (stay away from bubble-pack junk).

> Can I run a bace or is it strictly moble. Do you have repeater
> fees. Whot ih the freaq.range???
>
- Well... You can use a base, mobile, or HT (handheld) radio that complies with Part 95 and only uses the GMRS frequencies (noted below). Some folks have repeater systems set up that others (like yourself, when licensed) can use for free or on a membership-type setup. The fees go only towards the cost of the upkeep of the system and may not be used for profit per FCC Part 95 rules and regs.

The Frequencies are as follows (MHz):

Simplex: 462.550, 575, 600, 625, 650, 675, 700, 725.
Duplex (repeater input): 467.xxx (xxx refers to the frequency after the decimal)

> I have several questions ready to shoot at you all,but I'll stop
> there for now...
>
We're here to help. All you need to do is ask. If you want to catch up on your reading, check out the FCC Part 95 Rules and Regs for GMRS here:

It is very easy to begin communicating using GMRS. You may use base and/or mobile units whose power is limited to 50 watts. You MUST purchase an $80 license from the FCC before transmitting on GMRS. GMRS frequencies are in the 462/467 MHz range. Repeater inputs are located on the 467 frequencies. Some repeaters are open; however, some repeaters require a usage fee. _www.mygmrs.com_ (http://www.mygmrs.com) , _www.popularwireless.com/openrptr.html_ (http://www.popularwireless.com/openrptr.html) and _www.g-m-r-s.org_ (http://www.g-m-r-s.org) all have good information about repeaters. My website at _www.gmrs.net.tc_ (http://www.gmrs.net.tc) has good information for those new to GMRS.

At 06:46 PM 11/18/2006, kevin asato wrote:
>No easy but with a sturdy pair of diagonal cutters.

Most good mobile antennas are made from stainless steel wire that is pretty hard. My experience is that you'll ruin a pair of diagonal cutters trying to cut a mobile antenna with them.

What works for me is to use the edge of a small file to score the antenna wire at the point where you need to cut it. Then take two pairs of pliers, one on each side of the score, and snap the antenna at the score.

Alternatively, if you have a Dremel or other rotary tool, you can use a grinding wheel or abrasive cut-off wheel to cut through the antenna.

Thanks Stan for the links. The antenna adapter is still a mystery though. Icom has some sort of adapter but it states for testing only. Is this connection an industry standard and does any one make an RF adapter.

Hello:
I'm looking for coax recomendations for my GMRS base station. I have used Belden 9913 in the past on some railfan scanners and it worked well. Just curious if there is something better for GMRS. I'm not interested in hard-line because I don't know how to work with it and I understand it's expensive.
I'm using a 30ft mast and would like to keep the total run under 60 feet.
Any advice appreciated.

Danny, I use LMR 500 on mine but as you don't
want to go that route, try this site: http://www.radiobooks.com/

Go to the coax section and you'll see a 'flex' #9914. A friend
of mine uses it and is happy with it. I have also bought from
this company. Good service and reasonable prices....

I have a Motorola MOSTAR UHF Radio. I bought this item off eBay with intention of using it on GMRS. It was supposed to be pre-programmed, however the seller decided not to do so after the sale. Anyway, it's been too long now to try to return the item. I am wondering if anyone on here has any info on this radio or programming instructions?
Does anyone else on here have one of these radios?

Add one more type, LM400 Ultraflex. Ultraflex says it all. It's much
easier to work with if you don't just have a straight run.

Unless you have a PROM burner, your S.O.L. Assuming you find some
one/place to get the PROM burned to your freq's (& PL's), you adventures
don't end there. You have to go through and realign the entire unit. Good
Luck!

I'm afraid it's not good news. This model uses a EEPROM, not the PC programmable approach used by newer radios.

Well, I know I'm going to get chewed at saying this, but since you want cheap, you may as well want the best of the cheap as well. Radio Shack (Rat Shack to me) sells RG8 coax at 50-feet for $20. That's cheap and good coax. If you go over the 50 feet on RG8 (with this stuff from rat shack) you start to loose some of your signal.

The next best thing to use for your money is LMR400 coax. Not recommended for repeater use, but definately great for base use. It's inexpensive and can easily be found on eBay.

I actually recommend getting the LMR400 over the RG8 coax because of the way it handles your signal and you can run more footage with the LMR400 and not loose much signal.

One up from there (and it starts to get expensive) is the LDF4-50A coax which doesn't use braided shielding, but rather solid shielding, and has a hard foam insulator between the outer core, shield, and center pin. Very nice for your money.

Anyways, even though LMR400 is hardline, it still is inexpensive. Check it out and compare the specs between the RG8 coax. I use RG8 and LDF4-50A, and prefer the RG8 for shorter runs (50' +/-) and the LDF4 for larger runs (over 100'). LMR400 can be used for both.

Well the Mostar takes a special programmer made for it. It was the program before the RIB, also you need to take the top cover off to program. If it stills has the factory program in it there should be a list under the cover what it is. It also have a limit on the number of different PL/DPL codes.

Hi everyone,

I have some problems with my receiver end on my GE Mastr Executive II system (base-to-repeater conversion). The Detector won't reduce it's voltage and allow us to tune and align the receiver. So we need a new receiver module.

If anyone has any receiver modules (450-470) laying around that you can pass of for free or cheap, please contact myself. If you also know how to repair these units and would be willing to do so, I'll be happy to send it your way as well. This is the last step we have before our system is completed.

Many thanks and 73,

FYI: I have heard from several in the business and
know what they are talking about. Also my own
experience. Stay away from Radio Shack cable!
Not made well, inferior, etc., etc.

Just look at the shielding on RG58. Very thin and lax.

Stay away!!!

Subject: [GMRS] Best Coax for GMRS

FYI: I have heard from several in the business and
know what they are talking about. Also my own
experience. Stay away from Radio Shack cable!
Not made well, inferior, etc., etc.

Just look at the shielding on RG58. Very thin and lax.

Stay away!!!

12132. Re: Best Coax for GMRS

Yahoo group: GMRS (2005 — 2007)
Date: 2006-11-29 01:24:44 UTC
From: Ray_Vaughan_99
Topic: 12119 Message: 12132

Forgive the flashback...

Back in the day, when Radio Shack was in the Radio business (which leaves them today in the Shack business?) they had decent cable. IF you bought it off the reel. I still use some jumpers with the Tandy name on the coax. But also remember this was in the HF/CB days. I was happy to use their RG8 on my CB base installation at 27 MHz. But I don't think they ever claimed their coax was designed or spec'ed for UHF. Generally, if coax, antennas, protectors or anything has PL-259s, (aka 'UHF' connectors) it's not for use at UHF and above. Yes, the UHF name is totally misleading.

Now what RadioShack never did well, prebuilt cables. They used the worst press on connectors that usually pressed on and fell off. The jacket would always pull back and show you just how bad the sheilding was. I don't think their prebuilt cables had the same quality cable as their by-the-foot cable did.

Tandy brand coax, bought off the reel, with connectors you soldered on yourself, was fine for HF to CB, maybe VHF. But above that, use Belden cable and N connectors.

The technology has since moved forward, and today we have coax types like 9913. Better loss specs than RG8. BUT, there's a school of thought that says not to use this style of braid and foil cable in duplex (Repeater) operation. The theory is that, over time, the braid and foil can develop a disimilar metals reaction (AL v. CU) and you can end up with many feet of flexible diode. This can cause intermod within your own repeater. Said another way, the TX mixes in the coax and genrates noise in the receiver.

Another problem with 9913 type cable... the center conductor is solid. It move from the center of the cable if its allowed to bend. Since some of the dialectic is air, and the rest is weak plastic, there's not much to keep it in the center. This messes up the response of the cable (not 50 ohms at all frequencies)

And (it gets worse for 9913) don't use it where there will be a lot of flex. The foil will tend to break or wear down if the cable is allowed to flex too much over time. Good for base station installations, but not test cables, not to a rotor. In fact, in some cases, it can even conduct water. It is a long thin tube that can and will allow water to flow.

Now with all that said, I do like 9913 in some applications. RX at a fixed site, TX to the duplexer, places like that.

Like so many things, the right cable is the right one for any
application. While 12 guage Romex is good for 20 Amps, you shouldn't
use it as cord to go between your iron and the receptical.

Ray

There's a difference between RG58 and RG8. Especially with the braiding. And I have ripped them all apart before. A big difference, yes, between the RG58 and RG8. But the RG8 from Rat Shack or elsewhere is made exactly the same and is very good for runs of up to 50 feet. No more than 50 feet or else you need to go with larger coax or use an amp of some kind to carry your signal.

RG8 braiding has a thick layer of solid nickel braided wire that shields the cabling as well as uses it for your ground signal. RG58 uses the same nickel material, but is very thin and after a few bends or kinks in the line, it's lost forever until you repalce or repair that area.

RG58 is used for runs of 18' and shorter and for low wattage signals. You also have different kinds of RG58 (58U, 58X, 58A, etc) which tell you how it's made and what it's used for.

But whatever you have heard, only hearing doesn't justify the means. Using it and seeing it for yourself proves what it really is. Danny needed something simple to use and wasn't asking for alot. I think a good line of RG8 (wherever it comes from - Andrew, Times, Rat Shack) is the way to start for your buck.

From: Justin Bentzinger
Topic: 5075 Message: 12135

I got into this conversation late, so if this has been answered please accept my apology.

Icom has an adaptor, AD-98FSC, which screws to must of our portables in place of the antenna and accepts a BNC fitting on the other end. I use them for metering portables, but I have customers that use them with mobile antennas.

Retail price is $20.00 and I believe I have them on the shelf.

Thanks Stan for the links. The antenna adapter is still a mystery though. Icom has some sort of adapter but it states for testing only. Is this connection an industry standard and does any one make an RF adapter.

I don't agree. There are differences from manufacturer to manufacturer in RG8 coax that distinguish cheap, inferior coax from better coax. Things like the %coverage of the braiding, materials used for the dielectric and cover, etc. Generally, you get what you pay for.

That's exactly the point and wish I could have said it
better. I knew the gentleman was referring to RG8 but
my experience with Radio Shack's RG58 would
certainly keep me from purchasing any other cable
from them.....

Which is why I think that the RG8 is good for Danny to start out with. He's not asking for something expensive and long. And there are other RG8 brands on eBay as well. You could go with other kinds of coax, but they may cost more. Which is why I recommended to start with the RG8 and then I said to go with the LMR400 (or 500 that John thought of).

No worries. We all have our opinions and experiences in different areas. Mine is obviously not in coax. And no, I don't use the RG8 stuff on my repeater systems. I got the lovely LDF4-50A heliax. I just keep the Rat Shack stuff around for quick uses.

Hello, new to the group from Arizona. Greetings! I have a IC-F21GM on the way, and one of its main jobs will be to talk to my base station which will be a little over three miles away in a big city with some two and three story buildings in between. It seems to be a solid 4 watt radio with repeater capability and a good reputation. I would be interested though in picking up a 5 watt ht since in my case every bit of power I can get would be nice. I have noticed the 5 watt Maxon SP-140, but think the price is outrageous, and I would like to know if anyone can justify that price, especially when it only works with silly out of date floppy disk/dos software. I am not setting up some old stone-axe computer with dos on it, but I want to be able to program the radio I buy. What are they thinking? The ICOM I am buying has what it needs and can be modified with the keys. I have also seen the 5 watt Kenwood TK-308 which seems perfect, and can be programmed from the keys and display on the front, and it is only on ebay, and seems to be made in Australia or Asia. Problem is, I can find NOTHING about it on the internet. And that is a red flag to me. DOES ANYONE KNOW ANYTHING ABOUT THIS RADIO? Would it work? They can be had for less than $100 on ebay with everything. Seems to good to be true. Any help would be appreciated. Thanks in advance.

Maxon HT's are extremely good radios. I own several.
And what do you mean by silly out of date software on
a disk (dos)? What difference does it make as long as
the job gets done? Also, don't think you'll notice much
of difference with a watt.....

..hear someone in the RX on a FRS radio that has gone off frequency...

Total nonsense. If you are hearing FRS traffic on your GMRS repeater, then your repeater needs to be properly aligned. You should take your system off the air until you can get your act together. FRS units have tighter specs than some older UHF equipment...

I live in the most populous region of the country for GMRS/FRS users, and there is not one legitimate, documented case of an FRS unit being 'off frequency' and interfering with GMRS operations.

Well, the difference is (from what I have read), you need an OLD computer, running just certain versions of DOS (an obsolete software platform), and an understanding of DOS commands. You need all of this to program the radio. This is a Windows world, not a DOS world anymore. I just can't grasp why anyone would use this ancient platform to write software on. My base radio uses WINDOWS software, and is easy for anyone with Windows experience to use. I don't want to have to go find some old computer and tinker around with it just to be able to program a radio. All software made these days should be windows based and come on a CD, not a very unreliable floppy disk. I have seem many floppy disks that got corrupted just by inserting them into a certain computer. All information lost. Trash. And considering what this software costs that is unacceptable. Floppy disks are complete and utter GARBAGE.

Regarding your other point, yes I actually hear that Maxons are THE best radios, better than ICOM or whatever, and that is why this is a shame to me. Any programming I need done, I will have to pay a shop to do. New repeaters are supposed to be coming online in my area over the next year or so, and when I need a new tone associated with a channel, it will be back to the shop to pay $40 or whatever just to do that. Several trips could equal the cost of the radio. My ICOM IC-F21 HT allows you to associate tones with frequencies with the buttons on the unit. Do you know if any of the Maxon radios can do this? That would solve my whole issue.

Thanks for your input.

Michael, you have a number of misconceptions.

1) Most of this software was written years ago. And it works fine for the professional radio shops that are the real customers of it, so there isn't that much reason to change. Especially if you are talking about old radio models. I'm sure the newer stuff is a lot more up to date. If you want the latest and greatest then you have to pay for it.

2) The hardware interface used to program many of the radios requires strict timing of serial or parallel port pins. Windows doesn't give the programs the unfettered access to the hardware or processor time needed to accomplish this timing. That is why it's not a no-brainer to put the software on Windows.

3) Once a manufacturer has established a hardware interface they are not going to want to change it in an incompatible way just so you can more easily program your second-hand radio from ebay. Sure they could go to asynchronous interfaces, and they have in some cases.. but in general these standards tend to stick around a while.

As long as the radio shops and big fleets can program their radios, that is what they care about. End users are not supposed to be programming their own radios anyway.. it is SUPPOSED to be hard for the end user to do it. The manufacturers care about the business users, they don't make a dime off you.

4) Floppy disks are garbage? Ok, how old are you, really??? Floppy disks work fine, but you seem to have some scars maybe from an unfortunate childhood floppy drive incident??? It is just like any other media.. if you don't want to lose it then back it up. Floppies only became obsolete a few

years ago. I was using them for 20 years before that with relatively few problems. The old computers worked. They worked just fine actually.

In SUMMARY.. yea the stuff is old. But there is nothing wrong with it. IT WORKS. If you want to program old radios that use old protocols you need the right stuff to do it. It sucks but sorry dude you are not the target market for radio manufacturers. You are a bottom feeder as are we all. Deal with it. As I said, if you want the latest and greatest, you have to pay for it. Have you priced new commercial radios lately??? They are not cheap.

It isn't that hard to get a copy of MS-DOS somewhere or download FREEDOS.. or just steal a copy of Windows 95 or 98 somewhere and boot it into DOS mode. Get a floppy somewhere or get someone to copy it to a cd for ya. If it turns out you need an old computer they are still easy to find for free or close to free.

Or.. you can pay a shop to do it. I beleive this has changed recently but for most of history it was ILLEGAL for you to program your own radio. That is why it requires special software to do it, because you aren't supposed to be doing it... So if you get yourself set up to do it and avoid paying the shop, then pat yourself on the back for getting one over on da man...

Or.. chose your radios from among the few that have less onerous programming requirements.

-Ben

12146. Need help. HT Advice needed

Yahoo group: GMRS (2005 — 2007)

From: n3hat@fuse.net
Topic: 12146 Message: 12146

1. Don't buy a radio for GMRS use that is not Part 95 certificated. Get the FCC ID from the seller and verify it on the FCC website or from other knowledgeable sources. Part 90 certification (formerly called Type Acceptance) doesn't cut it; it has to be Part 95.
2. Don't waste big bucks for another 1000 milliwatts of transmitter power output; the difference between 4 watts and 5 is less than 1 dB, which is the minimum you can hear.
3. Invest in better antennas and feedline. A better antenna site, higher-gain antenna, and lower-loss transmission line not only increase the strength of your transmitted signal, they let you hear weaker received signals also.
4. Keep an open mind; don't come in with a chip on your shoulder about programming software that doesn't look like the latest shiny stuff. There are a lot of older, still-serviceable radios out there for which the manufacturer has no incentive to rewrite the configuration software, since the radios are not being produced any more. Be aware that the software to configure a 20-year-old radio was written to run on a 20-year-old computer. If you can't accept that, then that $20-on-Ebay radio is not a bargain for you if you don't have the $20 computer to run the configuration software; don't buy the radio and then whine to us about it.

Regards,
Bob

If you cannot accomplish what you want with 4W, then 5W won't make any difference.

You can improve the 4W HT's antenna - THAT would be a worthwhile improvement. But don;t sweat a one-Watt difference in a HT!

Not true. I am programming my ICOM radios (several models) using a Windows XP laptop rated somewhere around 1.6 gig. Works just fine...

We have been selling radio's for many years now and one thing we don't do is sell the software or program cables or RIB's . Before we sold radio's there was a number of high schools kids that got there own radio's, software and cables. No one was safe from them, local repeaters, police and just the local drive in food place like Mc D's. They would program anything they could and just use others repeaters at will. After some time the local police with the help of the FBI, I was told got them.

And every body and any one should program radio's? I think not. Also Maxon was both out by Midland. We when we have it sell Maxon at low cost or give them away. There is a lot better out there, Big M., Kenwood, Icom and EF Johnson.

> Floppy disks are complete and utter GARBAGE.
>

Michael, you have a number of misconceptions.

1) Most of this software was written years ago. And it works fine for the professional radio shops that are the real customers of it, so there isn't that much reason to change. Especially if you are talking about old radio models. I'm sure the newer stuff is a lot more up to date. If you want the latest and greatest then you have to pay for it.

2) The hardware interface used to program many of the radios requires strict timing of serial or parallel port pins. Windows doesn't give the programs the unfettered access to the hardware or processor time needed to accomplish this timing. That is why it's not a no-brainer to put the software on Windows.

3) Once a manufacturer has established a hardware interface they are not going to want to change it in an incompatible way just so you can more easily program your second-hand radio from ebay. Sure they could go to asynchronous interfaces, and they have in some cases.. but in general these standards tend to stick around a while.

As long as the radio shops and big fleets can program their radios, that is what they care about. End users are not supposed to be programming their own radios anyway.. it is SUPPOSED to be hard for the end user to do it. The manufacturers care about the business users, they don't make a dime off you.

4) Floppy disks are garbage? Ok, how old are you, really??? Floppy disks work fine, but you seem to have some scars maybe from an unfortunate childhood floppy drive incident??? It is just like any other media.. if you don't want to lose it then back it up. Floppies only became obsolete a few years ago. I was using them for 20 years before that with relatively few problems. The old computers worked. They worked just fine actually.

In SUMMARY.. yea the stuff is old. But there is nothing wrong with it. IT WORKS. If you want to program old radios that use old protocols you need the right stuff to do it. It sucks but sorry dude you are not the target market for radio manufacturers. You are a bottom feeder as are we all. Deal with it. As I said, if you want the latest and greatest, you have to pay for it. Have you priced new commercial radios lately??? They are not cheap.

It isn't that hard to get a copy of MS-DOS somewhere or download FREEDOS.. or just steal a copy of Windows 95 or 98 somewhere and boot it into DOS mode. Get a floppy somewhere or get someone to copy it to a cd for ya. If it turns out you need an old computer they are still easy to find for free or close to free.

Or.. you can pay a shop to do it. I beleive this has changed recently but for most of history it was ILLEGAL for you to program your own radio. That is why it requires special software to do it, because you aren't supposed to be doing it... So if you get yourself set up to do it and avoid paying the shop, then pat yourself on the back for getting one over on da man...

Or.. chose your radios from among the few that have less onerous programming requirements.

Reply, yep, true for ICOM, and that is why I program my ICOM on my windows XP laptop as well.
I am not hearing the best things about the maxon anyway. To really step up from ICOM I would need to buy a Moto and they are not cheap, I'll just stick with my IC. I just saw someone selling the maxon cable and software on a floppy disk and it gave me fits.

Someone else mentioned that they didn't want to see every Joe in town, including kids programming radios, and I agree. In order to buy the software and cable I think the seller should be required to verify the FCC license of the person buying it. Problem solved.

I won't buy old equipment, so I won't be whining. And you make a good point about why the old designs still use old software that they are not going to replace. Point taken about not chasing the extra watt. Good advice.

----- Original Message ----
From: "n3hat@..." <n3hat@...>

Subject: [GMRS] Need help. HT Advice needed

1. Don't buy a radio for GMRS use that is not Part 95 certificated. Get the FCC ID from the seller and verify it on the FCC website or from other knowledgeable sources. Part 90 certification (formerly called Type Acceptance) doesn't cut it; it has to be Part 95.
2. Don't waste big bucks for another 1000 milliwatts of transmitter power output; the difference between 4 watts and 5 is less than 1 dB, which is the minimum you can hear.
3. Invest in better antennas and feedline. A better antenna site, higher-gain antenna, and lower-loss transmission line not only increase the strength of your transmitted signal, they let you hear weaker received signals also.
4. Keep an open mind; don't come in with a chip on your shoulder about programming software that doesn't look like the latest shiny stuff. There are a lot of older, still-serviceable radios out there for which the manufacturer has no incentive to rewrite the configuration software, since the radios are not being produced any more. Be aware that the software to configure a 20-year-old radio was written to run on a 20-year-old computer. If you can't accept that, then that $20-on-Ebay radio is not a bargain for you if you don't have the $20 computer to run the configuration software; don't buy the radio and then whine to us about it.

Regards,
Bob

Date: 2006-12-08 01:21:15 UTC
From: Danny Harmon
Topic: 12157 Message: 12157

Anyone have any experience with TRAM antennas? I've found one that's fiberglass and supposedly delivers 6.1db gain over the 406-512 MHz band.
I'm looking for the best base antenna for under a hundred dollars. I'd rather not build anything, so that's not really an option.

Thanks for any input.

12159. Antenna for repeater

Yahoo group: GMRS (2005 — 2007)
Date: 2006-12-08 13:31:23 UTC
From: hazmatt1981
Topic: 12159 Message: 12159

Hi,
I have recently put up a GMRS repeater, which is running on a magmount antenna attached to a beam in a building (yeah.. it's for testing only). So far coverage is decent, but I would like to get it operating at peak performance. I have access to a reseller account on Tessco, and have looked at the GMRS antennas there.

Could some people give me your thoughts on what antenna I should use? Right now, with the magmount.. I'm covering about 13 miles.. fairly line of sight.. at that point it starts to break up with an HT.

Should I go with a unity gain? A 3dB... a 5dB? Obviously more dB is (usually) better. If I was getting decent coverage with a home-made j-pole, will the unity gain be just as good, or better? I just want to make sure I get a good antenna for the system.

PCTEL MaxRad MFB4500 Series
Cushcraft Corporation FRX Series
Antennex FG4100 Series

Also, what do I need to be conserned with as far as beamwidth, etc goes?

12160. Re: [GMRS] GMRS Base Station Antennas

Yahoo group: GMRS (2005 — 2007)
Date: 2006-12-08 14:52:33 UTC
From: Michael Ormandy
Topic: 12157 Message: 12160

I just put up my base station using the collinear 6db ground plan antenna from antenna warehouse. It is easy to adjust, sturdy and works well. $55 including shipping. I put a 25' mast up on my roof with guy wires, and ran LMR-400 cable, used good quality PL-259's, and am using a Midland MO-4032 45 watt unit as the base radio. I was very careful to solder the connectors correctly (see the article on eham and other places), and did everything very carefully. My one mistake was trying to use a $25 SWR meter off ebay to tune the antenna. Got it all assembled, put this meter on it and it nearly pegged the scale. After cursing, and a little thought, I went to Ham Radio Outlet and bought a real SWR meter. By diamond, and about $85 (ouch). Hooked it up and hit tx, and was under 1.5 SWR right off the bat. After some adjusting of the antenna, I got the SWR down to about 1.2. Yeah! With my ICOM IC-F21GM HT, I am finding a 8-9 mile range on average inside of the city I live in. I realized chasing around an extra watt in a handheld is fruitless, and that a good base station is the real key. My HT only has 2.7 ERP per the FCC grant, so it is no powerhouse, but works very well. The key was a good base station, and as you can probably tell I love this antenna.

Well If you Do the Math

the Icom F21GM is 4 watts In High power

then minus the transmission line loss then Multiply
by the gain of the antena this will Give you your
ERP.

Where did you Come up with 2.7 watts?
I dont know how many Feet og LMR-400 you ran.
LMR-400 is 2.7Db loss per 100 feet at 450Mhz
so lets say you ran 100 Feet.
with 4 watts out of the radio. and 6 db gain of the
antenna. Your actually putting out 7.8 watts ERP..

From: Michael Ormandy
Topic: 12157 Message: 12162

2.7 is the ERP that the FCC says the F21GM puts out with the stock duck antenna. I don't use this radio with the outdoor antenna though, I use a Midland MO-4032 unit as the base station, with the outdoor antenna. The F21 stays with me wherever I go.

Subject: Re: [GMRS] GMRS Base Station Antennas

Well If you Do the Math

the Icom F21GM is 4 watts In High power

then minus the transmission line loss then Multiply
by the gain of the antena this will Give you your
ERP.

Where did you Come up with 2.7 watts?
I dont know how many Feet og LMR-400 you ran.
LMR-400 is 2.7Db loss per 100 feet at 450Mhz
so lets say you ran 100 Feet.
with 4 watts out of the radio. and 6 db gain of the
antenna. Your actually putting out 7.8 watts ERP..

Thanks for the tip Michael.
I think I'll try that ground plane from Antenna Warehouse. It sounds like it's right in line
with my budget. I may bump up to a Maxrad MRX when funds loosen up next Spring.
I'm using a 25 Watt Maxtrac for my base station so power out won't be an issue and the
coax run should be 40 feet or less. If this antenna performs for me like it does for you, the
system should meet my needs perfectly.

Thanks,
Danny Harmon

I own and use the Hustler G6-450-3 for our repeater system. According to the model number, it has a gain of 6dB, and it's frequency is in the 450-470 MHz range. The antenna is only 7 feet tall, and can mount on any mast or tower or your choice. Cost me only $90.

I will bet they got ahold of a FPP ham radio opened up to the full bandwith not all the stuff needed for programing.

I have seen many ham radios like this that can transmit way out of the limits it was sold with.

Not pointing fingers but that is the most likley explination.

Why don't you try a a Maxrad 5db gain mobile
antenna with a base conversion kit? A good friend
has this and it works great for his base station!
With the base adapter kit you have to cut (score and
snap off) the ground radials to the range you will use.
It comes with a diagram. You don't even have to use
Maxrad, however they are very good antennas. They
also have the base adapter kit. Good luck.....

From: hazmatt1981
Topic: 12168 Message: 12168

Hi,
Quick question on paging....
Assuming that the transmitting station is licensed for GMRS, is it
legal to send out a page (one-way-transmission) for a user on the system?

Something like:
"Unit21 please call the office... Unit21, call the office, WQXXX3333"

or

"Dispatching Unit21 to 342 South Market St., for a blah blah, WQXXX3333"

It would seem that this would be legal, but wanted to see other's input.

Yes, one-way voice paging is legal in GMRS.

I'd have to check, but I recall some language around having some signalling tones in front of the pages.

It seems the rules read that you could do two-tone (possibly other format) pages as long as they were accompanies by voice. I don't know that is specifically says that the tones are required.

I don't see that as a problem. What are the RX units using as a RCVR? And are they licensed? A TX with callsign does not require the rcvr to respond I don't think.

I guess I could see that with all GMRS licensees with page TX from 40W base and RX by GMRS HTs in simplex. They would be possibly out of range but no answer on radio required. If the RXers are not licensed then I don't feel good about it because then we are only encouraging unlicensed GMRS TXing.

Quoting Joel Kogen <apolloviireact@...>:

> i have not read the rule for a long time but I think it a No no

It's more of a yes yes :)

Luckily this is a rule spelled out in black in white:

==========
http://www.access.gpo.gov/nara/cfr/waisidx_05/47cfr95_05.html
95.181 Permissible communications.

95.181 (h) A station operator may communicate a one-way voice page to a paging receiver. A selective calling tone or tone operated squelch may be used in conjunction with a voice page, as prescribed in paragraph (g) of this section. A station operator may not communicate a tone-only page (tones communicated in order to find, summon or notify someone).
==========

Nothing requires the person carrying the receiver to hold a license from what I can see.

So, does this mean that the Quik-Call feature on Motorola units is not permissible on GMRS? Not that I ever plan to use it, but I have Quik-Call capability on a number of my radios.

Thanks,
Danny Harmon

You can't use "TONE ONLY" You can send tones followed by a voice message. Just remember you are using "Quick Call" not paging! Bill WPXA-276

You can, you just need to transmit a voice message after the tones.

Well, with all the responses it appears that a tone + voice or voice only one page is permissable. The Tone only page appears to not be permissable.

The little call and rings the HTs have are OK as a lead in to a voice page but must be accompanied by a voive page.

That seemes to be the Reader's Digest version

From: Danny Harmon
Topic: 12168 Message: 12185

I have no problem with the "bubble Pack" crowd. Those radios have very limited range and they can be avoided with PL or DPL.
What I DO have a prblem with are those cursed "Call Tones"!!! Those things are the bane of any normal radio user's existence.
At several of our railfan events each year, we put the word out that we monitor channel 4 (462.6375MHz). Invariably there are kids who show up and , while they want to be part of the group, they annoy the rest of us by just pushing those damned call buttons incessantly. I really wish Motorola, Cobra, Uniden and whomever else make bubble pack FRS radios that they would drop that feature.

Rant Over.

We use DPL with a different one for both receive and
transmit it keeps people all confused and no hackers
have figured it out yet, but I can say in
Massachusetts , we really don't have as many of the
problems the rest of you nice folks have.

Yahoo group: GMRS (2005 — 2007)
Date: 2006-12-18 21:04:01 UTC
From: Ross
Topic: 12188 Message: 12188

I'm really new to this and I have a question about which radio to buy. We will be using GMRS/FRS for intra-neighborhood emergency use. Our group uses ham for its main operators, then blocks of neighborhoods use short-range GMRS/FRS to keep communication withing the neighborhood as much as possible. In other words, we want the short range for privacy purposes. However, I would also like a radio for repeater use. I'm sure the bubble packs, which are very much less expensive, will suffice for the intra-neighborhood use, but what is available for more distance and the repeaters? Someone in the neighborhood needs to monitor outside of the neighborhood. Do any of you have any suggestions, recommendations, or warnings about this kind of setup?
Thanks in advance,
Ross

I personally have no preference, but it seems like PL (CTCSS) is used more than DPL (DCSS). Our repeaters, though, are on CTCSS as well as the surrounding systems in my network in the area.

12190. Need help programming MO-4032

Yahoo group: GMRS (2005 — 2007)
Date: 2006-12-19 03:18:58 UTC
From: phoenixscanner1
Topic: 12190 Message: 12190

Here is the issue I am having. After purchasing the MO-4032 two weeks ago, and being very happy with it, and just yesterday getting the programming cable and software, everything works as it should except for one very important thing. I cannot program the radio to keep the squelch closed until it receives a certain ctcss or dcs code. I have tried everything and every combination of keys possible, but no matter what, the squelch can be opened by any tx, no code needed on the part of the transmitting radio. The MO-4032 trasmits with the dcs code (I picked 712), but it will open squelch for any radio and does not require the code as it should. Of course I entered the coded in the RX code column, but it doesn't matter. I tried several different codes, including CTCSS codes, all with the same result. You cannot make the radio require a code to open squelch, it opens it for any radio transmitting. Is this radio defective? Or is there something that I can do to fix this issue? Do you know of anyone I could contact that would, if you do not?

Thanks in advance.

I have used both PL & DPL, as well as "none" (CSQ)... range is not hindered by either! The addition of PL or DPL doesn't affect the "range" at all, it's simply an additional bit of information that your radio adds to the carrier product!

Pro's & Cons... by adding either (PL/DPL) to your "receive", you limit the amount of traffic that you will hear in your speaker, which in turn is both a pro & a con.

Hi Ross,

This sounds like a good implementation of the EMCOM NationalSOS setup. Read about it here. http://www.emcomus.org/commwp.html. This may help you tweak your setup but it sounds pretty good. Training is the key here. The ICOM IC-F21GM is a 4 what HT with the 8 GMRS freqs plus the 7 shared freqs, repeater capable, scan and tone scan features. The unit is field programabale, no PC and cable/RIB needed. Granted, the system is a little clunky (While holding PTT+W/N+MONI turn on the power, this requires two hands) it CAN be done. You can setup each freq independently of the others (repeater or not, PL). Hook it to an outside antenna up a tree and you should get at leat 4 miles out of it, the higher the better, just like 70cm HAM. This GMRS unit can act as a small base under current FCC rules and talk on the 8 GMRS freqs and the 7 shared FRS freqs. Make the small base op a HAM op as well and presto! you have the instant community bridge needed to get to the outside world.

The National Publicity VP at REACT has challenged all REACT teams in the US to a contest. The first team to hold a public/community meeting on this topic gets brownie points and national publicity.

Thanks Stan,
I appreciate the time and consideration put into your message here. I will take all into consideration. One of the reasons I asked the question is because that Icom seems to be the one and only from all I've seen and been told. I will study the SOS program thoroughly. I understand it gets lots of criticism, but so did the Wright brothers, and you should have heard what they said about Ben Franklin flying that kite. LOL
Thanks again,
Ross

Hook it up to outside antenna? I don't doubt you but wonder why ICOM says the adapter is for maintenance use only if you really can safely hook it to outdoor antennas? By the way, is there anyone who makes a higher gain duck antenna for the IC-F21GM?

Thanks.

I live in Canada and I bought a set of the Cobra LI6000WXC. I find them to be a good radio. I like the weather feature, as I do a lot of hiking and work outdoors. I am new to GMRS but FRS I have had many. I use the Radioshack "Mobile" FRS at home as a base-station, you know the one taken off the market a few years ago with the magnetic-mount antenna. Well anyway that radio I use with the Cobra LI6000WXC, I noticed the radioshack radio will not hear the ring from the cobra while in a ctcss code but will communicate well in the talk. I have talked to the homebase from accross town (6miles), I havn't really had a chance to put it to the test as of yet but I did notice I can use my old Motorola FRS hand mic. and Motorola ear mic. in the new Cobra radio and they work well.

FRS radios I have had:
2 Midland - not impressed with them. 14ch w/o (no codes)

2 Cobra 14ch (no codes) - not happy that they didn't have codes but that was when they first came out, FRS was new.

2 RadioShack Mobiles - really like them still use them.

2 Motorola - Liked them a lot till I had these new Cobra radios

I would recomend the LI6000WXC.

Guy

12198. Re: [GMRS] GMRS question

Hi,

There are no offical emergency channel on any GMRS/ FRS frequency...however, there are "gentlemens agreements" to monitor for emergency traffic on FRS channel 1, 462.5625, and GMRS channel 20, 462.675. This may not be the case on a national level. With a FRS radio, you may comminicate on any FRS channel. With a GMRS radio, and a GMRS license, you may communicate on any GMRS channel. Confusion comes with the so called "bubblepack, hybred" FRS / GMRS radios.

"can it be used for normal operations?"

This depends what you mean by "normal operations"..... The FCC changed its ruling on GMRS. Under its new rules, GMRS is to be used for family communications, and one family member needs a GMRS license to cover the family. So called "Emergency / Notifications" groups are discouraged, as this is not considered family communications.

For more info, you can visit www.popularwiresess.com or www.fcc.gov

Hope this helps.

From: Danny Harmon
Topic: 12196 Message: 12200

I don't think this rule is in place anymore as I hear occasional traffic on the "675" channel in my area. Sounds like "normal" communications to me.
When I first started using GMRS 9 years ago, I was always afraid to use 675. Now I use whatever channel is open and don't worry about it.
I also used to monitor FRS channel 1 (5625), but it's too congested anymore. I think most of the family users automatically revert to it.
GMRS is a family service, not Amatuer radio or the search and rescue patrol service. I think you're safe on 675.
Have fun!

>
> Hi,
>
> There are no offical emergency channel on any GMRS/ FRS frequency...however, there are "gentlemens agreements" to monitor for emergency traffic on FRS channel 1, 462.5625, and GMRS channel 20, 462.675. This may not be the case on a national level. With a FRS radio, you may comminicate on any FRS channel. With a GMRS radio, and a GMRS license, you may communicate on any GMRS channel. Confusion comes with the so called "bubblepack, hybred" FRS / GMRS radios.
>
> "can it be used for normal operations?"
>
> This depends what you mean by "normal operations"..... The FCC changed its ruling on GMRS. Under its new rules, GMRS is to be used for family communications, and one family member needs a GMRS license to cover the family. So called "Emergency / Notifications" groups are discouraged, as this is not considered family communications.

Hello there,

Actually it is not "emergency" in that sense, rather it is considered the "travel" channel but this is unofficial so it is available for use but you are likley to get more chat on it. When you say channel 20, you are actually referring to 462.675. I know some radios are not layed out the same but I am guessing yours is by your comment.

There are certain folks and groups pushing for two things, FCC recognition and designation of FRS 1 (462.5625) as an "emergency" channel and GMRS 6 (462.675) as an official info and emergency frequency but this has not happened. REACT teams do however monitor these frequencies (or should) to provide assistance and REACT International, Inc out of Suitland MD is one of the organizations behind these FCC requests.

Wikpedia has this to say http://en.wikipedia.org/wiki/General_Mobile_Radio_Service
Check it out. This is NOT an FCC rules, but rather general info.
Hope that helps.

From: Danny Harmon
Topic: 12196 Message: 12202

I actually would like to see more drivers use GMRS on the road, like CB is used, but without
the incessant yakking and those God-Awful "reverb" mics.
On a few occasions, I've had conversations with FRS users in traffic tie-ups on the interstate. They were parties traveling in two vehicles, moving a houshold or transporting a car and I picked them up by chance, usually on Channel 1 (5625) or one of the other low channels.
GMRS is a very useful service for this kind of road communications

12203. New Repeater

Yahoo group: GMRS (2005 — 2007)
Date: 2006-12-21 04:05:42 UTC
From: Walters
Topic: 12203 Message: 12203

Hi group,

Our York County (PA) REACT Team is putting our first repeater on the air tomorrow. We are doing this with the kind generosity of the Harrisburg Area REACT Team who gave us the repeater and duplexer. The Southern PA Comm Group, the local HAM repeater club is giving us space in their shack, space on the tower and the feedline and an antenna. In fact, everything is ready for us tomorrow. The radio was benched and tuned up. And the duplexer had its cavities cleaned and then tuned for our use by volunteers. We are going to keep the repeater quiet by using a PL other than 141.3 to start with while we figure out how well it hears and talks. After we discover what utility it has, we may open it up but eventually I will list it at GMRS.org.

Stan makes a good point and I want to also point this out about the "channel 20" comment. Unless you are using a radio service where the channel globally corresponds to the frequency (such as in CB or on a business band radio at your work), it will never be the same to another individual when referring to your frequency.

Channel 20 for me is 462.700. Channel 19 is 467.675, 18 is 462.675, etc. I use programmed radios, not bubblepacks. Even bubblepacks don't always correspond with each other.

If you want to refer to a specific frequency, just refer to that frequency so that everyone is on the same page.

As far as 462.675 being an emergency or travel frequency, at one time it was designated as that and recognized for being used in that manor. But today, most are not aware and don't use it in that sense. For those that do, we adapted a tone of 141.3 to this frequency as our travel tone or for local emergency use in our city/town. It's not required, but many of us have not changed it and have used it this way from when GMRS was recognizing this as a emergency tone/frequency (just like the ARS has their own calling frequency on each band, etc).

It is almost that time. The time when all of those $15 bubble packs get opened. Now that most of them have CTCSS and DCS, it will be hard to hide. And with re-chargeable batteries, we wont be saved by the death of their double a batteries as we were in years past.

There are horrible jammers in my area that talk like drunken sailors, along with kids playing mr. microphone and pushing call tones over and over, all on GMRS freuencies. They love to interrupt conversations, and butt in whenever they can with filthy talk, and sometimes viciousness. There are a couple of kids that like to discuss explicit sex, and drug purchases in my neighborhood as well. One troll had taken to making obscene comments to my wife in between transmissions. After programming my radios with CTCSS codes, he turned on his scanner and found the code, and was back to his trash talk again. Last night I found that fortunately my Icom HT and Midland base unit both support "non-standard" codes, and put in 254.1 on both. Now I see him keying up, but don't have to hear his foul garbage. It turns out that the cheap bubble pack radios don't accept non-standard tones, yet. Safe for now. It seems that GMRS is headed towards becoming the wasteland that is CB. I blame the FCC mostly, for allowing the "hybrid" radios, and for refusing to enforce the laws. Sad.

Howdy,

After reading your text message to the group, it sounds like you should start studying for your Technician Class License for Amateur Radio.. 99% of the Amateur Radio operators perform according to Part 97, for example , no swear words and no talking negatively to or about people..The exam costs $10. When you pass, the FCC issues the license free for a period of 10 years.. I've had my license now for a year and enjoy the hobby..You can always contact your local ham club and they can offer guidance and get you started..I should have done this earlier in my life!!

12209. Bubble Pack Motorola FRS/GMRS

Yahoo group: GMRS (2005 — 2007)
Date: 2006-12-22 15:26:06 UTC
From: Richard
Topic: 12209 Message: 12209

Purchased a couple pairs of Motorola FRS/GMRS Bubble packs, and disappointed that they dont have an option to do +5 split for repeater offset. Anyone know if any of the bubble packs can do this? As a GMRS licensee and repeater owner I would find it quite nice to use a bubble pack through the repeater.

Yeah, been thinking about that, and probably will. The only thing is, GMRS is nice (in theory) for my family because everyone including my kids can legally use the frequencies with our one licence, without my wife and others having to study for the amatuer license. At any rate, it is something I will do. GMRS still has a lot of potential for families, but the FCC needs to step up, and start enforcing the law. If the feds spent one tenth the effort on this that is spent on busting and prosecuting families where the kids have downloaded Britney Spears songs, we wouldn't be here though. I guess there just isn't a financial interest in it for them. Never mind just taking care of the public it is supposed to protect. But God forbid Janet Jackson's shirt is pulled open to expose a breast with a pastie on it. Now THAT is a matter of national importance, that must be the top priority for the FCC!

12212. Base Station, Bubble Pack Range Test Results

Yahoo group: GMRS (2005 — 2007)
Date: 2006-12-22 16:58:24 UTC
From: phoenixscanner1
Topic: 12212 Message: 12212

I include this test information for those of you who may be planning a base station setup in the future. Last night I measured my maximum range at 12 miles from my IC-F21GM to MO-4032. Sound quality was good at all ranges, up until the signal fell off. This was in a big city with lots of 3-40' buildings, with palm and pine trees as well. This is with the Antenna Warehouse 400-500mhz 6db 5/8 wave collinear ground plane antenna, connected with LMR-400, mounted 40' above ground level. Checking the old line of sight calculator, I can see much more range isn't really possible, due to the curvature of the earth, so I would say this is an optimal setup. I want to give the highest recommendation to these two radios, and this antenna. I really don't think the most expensive Motorola radios could have done any better.

Also, I completed some pretty thorough testing on bubble pack radio ranges recently as well. I tested all from the exact same markers / distances. After testing about a dozen of the most powerful bubble packs, I can report the two top radios / ranges as follows:

Midland GXT-600 - Just over 2 miles.
Midland GXT-400 - 1.75 miles.

All the others fell further back. Most were good for about a mile, somtimes a bit more. As a side note, if you really like scanning GMRS frequencies with your radio, and don't have a scanner for that, I would be tempted to choose the "15 mile" uniden radios, which came it third at almost 1.5 miles, and have a much faster scanning speed than any of the others (they should considering they make state of the art scanners). Having to hit the "power boost" button for high power is annoying, but could be gotten used to. Full disclosure, I have not yet had a chance to test Cobra radios, and I hear good things about them. That will be a future test when I can get ahold of some.

Moto makes a repeater capable bubble pack, but it is about $100 I believe. That really doesn't pencil in my mind, considering I bought my IC-F21GM for $90 off ebay, in mint condition, and there is no comparison to a bubble pack. I too could appreciate a low cost repeater capable bubble pack radio. Problem is, every idiot / pirate / jammer out there would buy them and many repeaters would become useless I am afraid.

Subject: [GMRS] New Repeater

Hi group,

Our York County (PA) REACT Team is putting our first repeater on the air tomorrow. We are doing this with the kind generosity of the Harrisburg Area REACT Team who gave us the repeater and duplexer. The Southern PA Comm Group, the local HAM repeater club is giving us space in their shack, space on the tower and the feedline and an antenna. In fact, everything is ready for us tomorrow. The radio was benched and tuned up. And the duplexer had its cavities cleaned and then tuned for our use by volunteers. We are going to keep the repeater quiet by using a PL other than 141.3 to start with while we figure out how well it hears and talks. After we discover what utility it has, we may open it up but eventually I will list it at GMRS.org.

12216. GMRS/FRS Voice Chat online internet Chat , Many Calltones/Codes/Channels..

Yahoo group: GMRS (2005 — 2007)
Date: 2006-12-22 22:55:41 UTC
From: Guy
Topic: 12216 Message: 12216

Has anyone come up with a Internet Chat program that functions like the GMRS/FRS radios you know with the call tones for your group, codes /channels mic., speaker etc.
Imagine voice chat through the internet with anyone in your group and code.

My brain just dosn't stop..... just think it would be cool.

Guy

12217. Looking for hybrid handhelds that have 5khz deviation on GMRS channels.

Yahoo group: GMRS (2005 — 2007)
Date: 2006-12-24 12:34:02 UTC
From: nwrebel
Topic: 12217 Message: 12217

I am looking for a set of hybrid handhelds that have 5Khz deviation on the GMRS channels, along with the required 2.5Khz deviation on FRS. Can anybody tell me which models have this ability?

We had a newer pair of 6000 series Motorola and they had about 2 Khz deviation on both FRS and GMRS- what terrible pinched audio! I know that 2.5 Khz deviation is the maximum for FRS but they should be able to go up to 5 Khz deviation on the GMRS channels. It would be a simple and very minor curcuit/software change to automaticaly change the deviation depending on which channel the radio is on. Motorola really missed the boat by not including this ability on this model.

Our family really needs the hybrid because we sometimes travel or hunt with friends who use FRS radios, and other times we need the range of GMRS.

I suspect that some of the higher end hybrids have the ability to use 5 Khz deviation on the GMRS channels but I don't want to just keep buying them and testing until I find the right one. If anybody has knowledge or experience with a model/s that will fit our needs, your help would be much appreciated.

Thanks!

Dean

While I may not entirely understand your question, here are a couple things you may want to check out.

http://www.goteamspeak.com/
(also described here: http://en.wikipedia.org/wiki/Teamspeak

another kinda fun thing is http://www.eqso.org/
This is like working a radio, over the internet. Some channels only let you "push to talk" if you have registered your ham license, but others are open, and it's easy and free to create your own channel. You could then invite others to meet you on that channel to talk. I'm not sure if you can keep others out, if it's a public channel.

The amateur radio licensees also have EchoLink available to them. It uses VoIP to connect Internet users and amateur radio users via repeaters, etc.

Question on IDing.... When you have several family members on simplex or on a repeater, how do you handle IDing? Do each of you ID every 15 minutes? Or does just one of the individuals under the license ID? It seems redundant and a waste of bandwidth for everyone under one license to ID every 15 minutes (or at the end of a transmission), but on the other hand, that seems to be how the FCC rules read.

What is everyone's take on this?

12224. Re: How does everyone here ID?

I ID ONCE during the conversation, at the end of the exchange. I think that's all that's needed. I'm also the ONLY person I've ever heard ID at all, so I figure I'm OK.
If you need to break every fifteen minutes to ID, then maybe you're gabbing way too much.

For a single person, you should ID at the begining, every 15 minutes (if needed), and clear your ID at the end.

For multiple users under a single license, the person who the license is registered to should ID. All others can use user ID's (User 231, User 396, User 277, etc.) under this license. If the registered person is not present at the time of the use of this callsign, then the person who used it should continue to use it and not pass it around the group.

Should the repeater owner or another user on the frequency want to contact that licensee on the frequency, he/she will know who to talk to directly and not have the need to guess.

This is also a standard policy on most systems and on mine.

Reasonably the rules pertain to a licensee. Each licensee needs to ID according to the rules, every 15 mins and at the end of a conversation. Units of the same license would be included by one person giving the callsign. Repeaters do NOT need to ID but are not prohibited from IDing.

12231. Repeater site requirements

Yahoo group: GMRS (2005 — 2007)
Date: 2007-01-03 15:23:24 UTC
From: Walters
Topic: 12231 Message: 12231

To all repeater owners, a question

My repeater site is NOT my home, but a location 2 miles away. The antenna is on a HAM club tower 100 feet up and the repeater is in heir shack (yes, very kind of them, they have a desired use).

The actual word repeater is only used once in the rules (95.29 (a)) and in a context which implies that a repeater is NOT a base, fixed or mobile station. From 95.29 (b) we infer that a repeater is NOT a mobile, control or fixed station.

So, does a repeater fall within the requirement established by 95.25 (f) for seperate reporting? It says base and control stations. Another words, do I need to amend my license by reporting the address of the repeater?

I do not see it explicited called out in the rules, and by inference it does not seem to be implied. However, those of you with a repeater site may have a experience from your practical experience.

Thanks

From: Ray_Vaughan_99
Topic: 12223 Message: 12232

Before I said anything, I wanted to sit back and see what people said. I think you got some good responses about the real world use of IDs. Back in the Class D (CB) days I got a NAL and a site visit from the FCC for IDing with a phonetic alphabet. Kilo Tango Mike 5428 rather than KYM5428. I appealed, they checked the tapes and they dropped it. I'm still rather annoyed that they made the threat. Clearly, FCC enforcement isn't perfect.

For what's it worth, on GMRS I do ID when I make a call "(name or callsign) this is (my callsign)" and at the end if I reach someone. I don't think I've ever had a conversation that went longer than 15 minutes, but from my ham training I'm pretty sure I would remember to ID.

My repeater does ID, in my recorded voice, WHEN NEEDED. It does not transmit an ID unless there has been traffic on it. I use this controller to do it, highly recomended: http://nhrc.net/nhrc-2/

Now, with all that said, I do need to point out the Rules that cover Station ID:

95.119 Station identification.

(a) Except as provided in paragraph (e), every GMRS station must transmit a station identification:

(1) Following the transmission of communications or a series of communications; and

(2) Every 15 minutes during a long transmission.

(b) The station identification is the call sign assigned to the GMRS station or system.

(c) A unit number may be included after the call sign in the identification.

(d) The station identification must be transmitted in:

(1) Voice in the English language; or

(2) International Morse code telegraphy.

(e) A station need not identify its transmissions if it automatically retransmits communications from another station which are properly identified.

Ray

Yea Jason, Lets be' real. All in our group ID
every 15 minutes as required. Now that's in a
continued conversation. We use our call sign
at the beginning and end if shorter. When you
do it, it becomes habit. I suppose its no
different than ham (as far as ID'ing) as they do
it as well.....

Ahh this is true... my wife is not the licensee.. I am... ok this makes sence... so I ID (as I've been doing)... but she does not need to.. and neither do the kids.... unless, of course, I'm not on frequency talking to them.. then whoever started the conversation should probably ID...

--- In GMRS@yahoogroups.com, "Walters" <abacuspc@...> wrote:
>
> Reasonably the rules pertain to a licensee. Each licensee needs to ID according to the rules, every 15 mins and at the end of a conversation. Units of the same license would be included by one person giving the callsign. Repeaters do NOT need to ID but are not prohibited from IDing.

I always ID when on the mobile or base. But when we're in the field on the handy-talkies, we rarely ID except possibly at the end of a long transmission.

Hi Stan (and others),

This is a good question that I have thought about before, but not this in depth. A repeater should not constitute as a small base station or be catagorized under that subject. The reason is because a repeater has two seperate functions/operations within it's system. A transmitter and a receiver. Both of which operate independantly and therfore do not work together to create a base station. ... A base station transmits or receives. It cannot do both.

However, you could say that a repeater (in some ways) is like a base station, but when compared to FCC's Part 95 description(s), it takes on another new meaning and not what we see them to be.

So in regards to your question, I don't think you need to amend your license or state it's location (file a report) to the FCC unless otherwise notified directly from them.

If you should have a need to further pursue this question, I'd contact Riley Hollingsworth at the FCC. He has dealt with many cases and questions in this radio service and would know the answer. His email address is: riley.hollingsworth@...

Greetings Stan

It used to be that the license forms required for GMRS included repeater coordinates and height info and much more technical info. Those requirements were dropped somewhere around the 1998 regs re-write (I think that was the date).

Now, you need only set up your repeater, post a copy of your license on the unit and away you go (assuming no interferrence issues are present, you have permission from the site owner, etc.).

12240. Repeater replies

Yahoo group: GMRS (2005 — 2007)
Date: 2007-01-05 04:26:21 UTC
From: Walters
Topic: 12240 Message: 12240

Thanks to you repeater operators who responded to my query. I think I am good to go. Now with a working repeater covering a good 1/3 to half the county we are ready to advance the NationalSOS program.

York County REACT will now hold a series of public meetings. We will invite volunteer participants from a few neighborhoods at a time. We will offer FRS training as well as GMRS training and licensing help. If we get interest on one visit we will go back to do the rest. The biggest hospital in York already has a HAM station and we have H.E.A.R.S. drills a couple times each year. The man in charge of the EOC for the hospital is on my REACT team. I think we can now persude him to add a GMRS Station there and have his staff get licensed. At a minimum they will add GMRS to their scanner array.

I have had one contact over 15 miles away from the repeater. I am tickled pink by the performance. I have also spoken to several other GMRS operators now. They heard me out testing the repeater.

Thanks again, later

Stan

Yes... well... I was trying to be funny... but actually speaking in all seriousness.
GMRS is The Wild West and I think the few of us who ARE licensed are doing fine to ID once in a string of transmissions.
I've been in all-day events at which I may have given my call sign three or four times. I also talk frequently to UN-licensed FRS users.
By the way, my call sign is WQFE480.
Am I in trouble now?

Yes...but if you read the story it says the guy was going on for
NEARLY AN HOUR without ID'ing. 20 minutes in another case.
I don't think any of us would ever do that.
Of course, I would also hope no conversations lasting NEARLY AN HOUR
would ever happen on GMRS.
The original question was "how often should I ID?"
I guess my response is "and the end of your conversation or every 15
minutes, whichever comes first...and 15 minutes should NEVER come
first."
That droning "yakkity yak" happens regulary on 2-meters. It's my
understanding that this is not what GMRS was intended for.

Thanks,
Danny Harmon

I have heard two guys talk on GMRS here in town for a half an hour at a time. They run out of things to say, and sometimes just say "yep". They sound like a couple of hams that decided to build a GMRS repeater. Of course, their repeater is private, so only they can use it, and say nothing for 15 -30 minutes per conversation.

A 'repeater' is neither a 'base station' nor a 'control station' as described in the rules. Therefore 95.25 f does not apply.

From: Danny Harmon
Topic: 12223 Message: 12255

I agree completely, Michael.
Fortunately we don't seem to have any of those in my area...yet.
I suppose it wouldn't be so bad if they were just talking simplex.
But tying up a channel for that long with a repeater.... gad!

I'll admit I'm just a ham-and-egg user of GMRS, but I don't
understand why hams would want to come over on this service. It
seems they have far more latitude on their own bands.

Thank you Walter.

Based on all the responses, which all concurred with one another and what I was thinking, one does NOT have to do anything to start up a repeater other than possibly coordinate with other owners to avoid freq/tone duplication.

Anybody else in York Co PA? Contact me off list to have more discussion about local GMRS repeater coordination, REACT, etc, thanks. Either email below will work but the comcast one I check daily, yahoo one almost daily.

A 'repeater' is neither a 'base station' nor a 'control station' as described in the rules. Therefore 95.25 f does not apply.

12257. Interference from FRS

Yahoo group: GMRS (2005 — 2007)
Date: 2007-01-11 05:16:40 UTC
From: Walters
Topic: 12257 Message: 12257

I have a constant broadcast on 467.5625. That is an FRS freq in the 467 interstial area mixed in the GMRS repeater input freqs. I took my HAM HT in the car and drove until I peaked the S meter on my external antenna. Then I hooked up the rubber duckie to decrease sensitvity allowing my zero in on the one spot where S meter strength was full blast 10/10.

What do I do now? This station has been broadcsating dead air for days. I don't really care as I don't need to use 467.5625 but when I monitor FRS and scan FRS I have to SKIP or lockout 467.5625 in order to not stop on it every rev of the scanner.

Hi All,

You are going to find a growing number of HAMs embracing FRS and GMRS, why? Because their non-licensed family and friends. The popularity of FRS is undeniable. And GMRS is a no test version of 70cm HAM with more latitude for use. I think we are just starting to see the beginning of direct access frequency radios (like HAM HTs) for GMRS. Repeater ready with memories to store 99 configuartions of GMRS/tone/repeat combinations without the need to Moto type big $ cables and software. Moto's days are numbered in the GMRS market. Not that they don't make good rugged stuff, but GMRS users don't need it.

Even more important however is the EMCOM model here -> http://www.emcomus.org/commwp.html FRS in every house, GMRS small base in every neighborhood with repeater capabilty to HAMs with scanners or GMRS to collect community wide data and get it to a county EMA center for dispatching.

This model was devised by HAMs after Katrina. More and more 1st responders now carry FRS with them. They are great for short range incident comms and also the obvious connection to the public. Imagine firefighters able to talk to residents in a dwelling and talking them out thru a safe path without endangering fire fighters lives by having to enter the structure to make a rescue.

Here in York County PA, REACT has a very cooperative working arrangment with HAMs (ARES/RACES) groups. They welcome our GMRS repeater as a backup to 2m/70cm and a way to possibly off load 2m/70cm for local comms within a smaller area. However, I have already demonstrated that my GMRS 10w repeater has coverage rivaling the club's 45w 2m repeater. They were hoping to cover just our little borough as part of the borough EOC plan. Instead the whole southern core of the county is covered. Once we announced our repeater as operational I started getting invites to all kinds of meetings and training. I don't know how many REACTers might subscribe here but if you want credability for your team, get yourself a GMRS repeater in operation. It will change the way the rest of the emergency community views you as an organization.

OK, sorry for the rant, I know this is not a REACT group but that is my f reason for GMRS at the moment. Still good discussion. I ahve another topic I will make a sepearte post.

You need to contact the FCC, in my opinion. That is going to take time. If you go to the PRA website or the popular wireless forum, there is a guy named Doug that is an expert in dealing with GMRS violations. He once sent me an official form that you can fill out and send to the FCC that really gets their attention. I used it to deal with two commercial pirates. I wouldn't suggest dealing with the person yourself. They are obviously violating several rules (frequency camping, failure to identify, and probably are broadcasting with more than the allowed 5 watts). I have no stomach for jammers and pirates, and deal with them when I come across them, but through the legal channels of course.

I wonder though, what kind of a radio they are using that is capable of constant transmission day in and day out without it self destructing. I think that would take a serious transmitter.

I wonder if that's some other kind of gadget that's sending out a harmonic that's pinging 467.5625. Could a regular radio transmit that long without burning up or just dying?
I'll be interested to hear the outcome of this.

12262. Repeater Question

Yahoo group: GMRS (2005 — 2007)
Date: 2007-01-12 22:00:45 UTC
From: Michael
Topic: 9980 Message: 12262

Hi all,
I have a Micor Repeater that I am trying to get setup on GMRS, I have programmed in all the channels in a scanner and had no activity, so the channel is not that important. Does anyone have a spare set of channel elements laying around that they would part with fairly inexpensively?

And, yes, I am licensed.

Thanks in Advance,

Michael Stone

From my experience and with talking to my contacts here, the best you can do is take down all the information you have on the person interferring with the associated frequency. Being that it is a part of the GMRS band (doesn't matter if it's shared with FRS or not), since you are licensed within the GMRS, you can actually inquire on the matter. But as for taking the problem into your own hands, I'd leave that up to those who do it every day (PRA, FCC, other private orgs, etc).

Info to log:
- transmitter's coordinates (location)
- time(s) of day it transmitts
- TPO or ERP wattage (if able to meter)
- Frequency and any associated tones
- Any noted conversations or callsigns (if any)
- Any attemps to communicate with the person
- Any other information that you can supply that could help with this issue

Then send it into the PRA or FCC. Or send it to both via email and CC them both. For the FCC, I recommend contacting Riley Hollingsworth. However, if this issue is not serious and is not causing major interferrence to any other frequency or other station, then I'd try to contact the person directly and advise him of what he is doing is illegal. He may be unaware that his radio is keyed up. He may also be 100% legal, but just not know that he is transmitting.

Michael, before proceeding, please check that your Micor repeater is type certified for Part 95 (GMRS). If it is not, then it is not worth looking for channel elements since you would not be able to use it legally for GMRS.

Hi Michael, Yes the Micor is ok to use as a GMRS repeater and many are being used for that purpose. The question I do have to ask so that there is some clarification is Do you need just the channel elements or are you looking for elements with the crystals already in them for a channel? Also you can always check a radio at the FCC site using the model numbers . Steve WQDW656/N4YZA

That will be very expensive. I'd actually do it yourself (if you have a a few meters to tune the crystal - very simple - takes 2 minutes). Most crystal manufacturers will also allow you to send in your crystal modules and they will tune them for you, and then you can fine tune them when you receive them back at the shop. But I'd just buy the xtals and solder them in yourself.

Or even look on eBay for xtals or Micor modules with your channel pair. Some businesses can make them for you at a great price (as they did with ours) and ship them back.

From: Michael
Topic: 12276 Message: 12276

Does anyone have the programming manual and software for the Zetron 45B Z-Patch. I inherited a repeater with this, and it has no books or software.

Thanks

Michael

Contact Zetron at 405-820-6363. They can help you with any manuals, software, or any tech help while you're on the phone. They're located in Redmond, WA.

Very helpful when I had problems with my Model 38A controller.

From: n4rpd
Topic: 12278 Message: 12278

Are there any GMRS licensed operators from Colorado Springs that read this group?

Are you interested in forming a local Coordination and Users Group?

I have spoken to a few operators on the .725 repeater and some of you have expressed in interest in forming an informal group for repeater coordination and discussion.

If you are interested please email me at n4rpd@adelphia.net or reply back to the group.

Thanks,
Rob DeVega

From: Michael Ormandy
Topic: 12223 Message: 12280

I almost always ID at the end of conversations. However, to be honest, if someone actually gets a license nowadays that is almost amazing, let alone actually ID'ing. I live in a 3 million person city, and thousands upon thousands of the cheap gmrs radios are sold. There are only a handful of people who have bothered to get licenses though, per the FCC database. From what I hear GMRS is going to be turned into a freeband by the FCC within a year anyway. But that might just be talk.

I have read that on popular wireless a few times in the last month or so. It does seem possible, as enforcement of this band is nearly non-existent, and the FCC has allowed the current situation where people can buy GMRS radios from Walmart for $10.

At any rate, it is a rumor until we see proof.

Since when is the FCC's responsibility to decide who can sell radios and at what price ?

Based on the logic, the best way to reduce traffic congestion of the highways is to put a $50,000 excise tax on each new auto and an extra $5 per gallon tax on gas. This is in fact what quite a few countries do. I lived in Malaysia for a short period where the gov't tax on my company car was $41,000. My other choice was to buy a tiny 'Proton' model (a very tiny and tinny Toyota with a 60hp engine that did get almost 15km/liter (about 40+mpg). Talk about 'social engineering !!

Why not? Isn't it the FCC that requires that HF linear amplifiers be sold with the 10-11 meter band disabled so that hams have to modify it to use it on the 10 meter band? They have the authority, and nobody else does, so why not use it?

I don't know how everyone else rates, but up here in Northern California, we don't have a bunch of illegal GMRS traffic. Only FRS traffic. If they are talking on the GMRS freqs, I haven't heard them because the packs are so cheap and the wattage is so low.

In most areas in the US, it really isn't a bother for us on GMRS. However, for the rest who are in over-populated areas and congested areas with no awareness of the frequency usage (groups, orgs, etc), you will tend to have some problems. It can be resolved via person by person instead on complaining about it to the FCC (papers being piled up), and will probably cut down on the amount of work that they already have to do in other radio services (one-way, two-way, third-party, broadcast, pirate, etc).

When they allowed the hybrid radios it was obvious what was going to happen.

Combining FRS and GMRS equals cheap radios, that people are told can be operated without a license. $10 pairs of radios sold by a guy telling you no license is needed, usually equals no license. Their failure to enforce the rules and punish those responsible, among other things has contributed. How many are going to buy these things and then buy a 85$ license? Answer: Not many. Now they allow the rino which transmits data on GMRS frequencies (not supposed to be allowed), and uniden radios with voice inversion (not supposed to be allowed). Also now, they are accepting marine/GMRS radio hybrids, that are already cheap. Of course, it doesn't surprise me that there is now rampant piracy in my city, on the marine band (in the middle of a desert). When GMRS radios were GMRS only, they were real radios, and they cost more (and worked better). People bought licenses with them. That has all changed now. I live in a 3 million person city with only a handful of licensees.

And yes, the FCC has had a big role in this unfortunate evolution. They sold out to the big money influence of the manufacturers, and now GMRS is headed towards being the wasteland CB is. Some will say, "get your ham license". I will say, NO, I want the moderately powered family service, with one license covering my whole family. The one I paid for a license to have. The one that shouldn't be, but is dominated by pirates who paid $5 each for cheap radios and are damn sure not going to spend $85 for a license 99% of the time! I will not ever let the FCC off the hook on this. They allowed this mess,a nd they are going to get credit for it!

I live in the most populous region of the nation's most populous state, and we're getting along just fine on the GMRS. When problems arise, they are taken care of. There has not been ONE documented case of a FRS unit interfering with GMRS repeater operations. And since most of the consumer-grade GMRS radios are not repeater-capable, they are not posing a problem for GMRS repeater ops, either.

On the very few blatant problems when the FCC has been needed, they have responded appropriately.

An idea just in case the FCC really does want to drop GMRS licenses:

Require a license for repeaters and base stations. Waive the need for licnese on mobiles below a certian wattage (4?) and all handhelds.

Prohibit the manufacture of low wattage radios with DPL (digital PL) encoders. (Or is that too late? Are there any now?) If a GMRS licensee has unlicensed traffic on his input frequency he doesn't want to repeat, he can implement a DPL decoder.

Thoughts?

Hopefully there will be a comment period for a NPRM.

They DO type accept radios for a specific service. The point being made is that they, the FCC type accepted a radio(s) with a) unlicensed FRS freqs and (b) licensed GMRS freqs, in the same radio. That would now appear to have been a blunder of large proportions. One rumor is that RS made the original and sold a bunch before approval? so the FCC let it go?

While the FCC can tell a merchant/retailer whether or not they can sell radios and at what price, the FCC decides what the techincal specs for that radio will be. I don't think there is any disagreement here. The FCC could fix it buy changing their type acceptance rules for GMRS and have all the then "illegal" raduios removed from retail shelves but the cat is already out of the bag on 12 million of them. However, they will soon stiop charging or some other malfunction and they would phase themselves out so to speak.

I said they were rumors. I never said there was an official announcement.

I am not talking about bubble packs interfering with repeaters. As you noted bubble pack radios are not duplex capable so that is a moot point.

I am happy to hear you don't have a problem with piracy in your area. Great news. But sadly that is not the case in many places. I am talking about pirates ruining simplex operations. Most GMRS users do not use repeaters. I have no use for one. My base station gives me a 13 mile range with my ICF21, and that covers my needs. If I find someone in the future who wants to share costs, and it would be of some use to me, then fine. What we have here is typical family simplex users, who have a hard time finding a clear channel due to jammers and pirates. I also know that many areas of the country have the same issue.
It is easy to understand why people would feel GMRS is headed for freeband status. Actions speak louder than words. Allowing Garmin to make the rino so that it transmits data on GMRS frequencies was an obvious sign they don't even respect their own rules. Mark my words, it may not be tomorrow, or next month, but this band is headed the same direction as CB unless something changes.

When you have more illegal users than legal users on a band, that is a pretty good sign that there is a serious problem.

Just because it doens't directly impact you, or your area YET, does not mean that it is not an issue. You will feel differently someday when audiovox and the others start releasing $20 pairs of DUPLEX bubble pack radios (God help us). But it will be too late, and it may already be too late to change the course of future events. Oh well, there is always MURS, which you can't buy in a bubble pack.

Almost every bubble pack radio has DPL now. I just bought some midland GXT-600 radios that have DPL, and I have seen several others. Too late. The only way to really lock down your radios now is to use DTMF / CTCSS combos. That makes sure you won't be hearing from bubble pack radios.

Another alternative: most "real" radios have non-standard pl codes that bubble packs do not have. I use 254.1 I believe it is, on my radios. Both my Icom ICF21GM and my MO-4032 have that non-standard tone. Nobody ever breaks my squelch.

Nonetheless, any radio noise (I call pirate tx noise), interferes with legitimate users, whether they can open your squelch or not.

I agree. Type accepting those radios was the key mistake, if it was a mistake. It was an abdication of their responsibility and a disservice to the public. And it encourages disrespect for their own rules.

Let's hope they do better in the future.

Thank you, someone gets it.

Yes, it was a huge blunder. In one fell swoop they virtually doomed the band. But there is always some hope that they might do what you are saying, if enough pressure is applied. People are accepting the situation now because of one fact. That is that there are no cheap DUPLEX bubble pack radios available. Once that changes LOOK OUT! It is only a matter of time before someone does it. Maybe they will be "30 mile" radios too! Why not? We already have "18 mile" bubble pack radios, lets just up the ante while we are at it, why not?

They DO type accept radios for a specific service. The point being made is that they, the FCC type accepted a radio(s) with a) unlicensed FRS freqs and (b) licensed GMRS freqs, in the same radio. That would now appear to have been a blunder of large proportions. One rumor is that RS made the original and sold a bunch before approval? so the FCC let it go?

While the FCC can tell a merchant/retailer whether or not they can sell radios and at what price, the FCC decides what the techincal specs for that radio will be. I don't think there is any disagreement here. The FCC could fix it buy changing their type acceptance rules for GMRS and have all the then "illegal" raduios removed from retail shelves but the cat is already out of the bag on 12 million of them. However, they will soon stiop charging or some other malfunction and they would phase themselves out so to speak.

Since when is the FCC's responsibility to decide who can sell radios and at
what price ?

Based on the logic, the best way to reduce traffic congestion of the
highways is to put a $50,000 excise tax on each new auto and an extra $5 per
gallon tax on gas. This is in fact what quite a few countries do. I lived
in Malaysia for a short period where the gov't tax on my company car was
$41,000. My other choice was to buy a tiny 'Proton' model (a very tiny and
tinny Toyota with a 60hp engine that did get almost 15km/liter (about
40+mpg). Talk about 'social engineering !!

Hopefully the manufacturers will decide duplex radios won't sell to the bubble pack buyers. Most of those folks won't even know what "duplex" means.

The FCC is capable of huge mistakes, even when warned. The ARRL (ham radio lobby) screamed like hell when the FCC proposed to put the Citizens Band on 11 meters, predicting the chaos that would occur on a band capable of worldwide propagation, especially because of the easy modification of high power ham radios to work on that band. They did it anyway, and all the predictions were proven true, and then some.

Nonetheless, it is important that citizens stay on top of proposed FCC action and make themselves heard. You can't blame the FCC if no one objects and raises the important issues.

I said they were rumors. I never said there was an official announcement.

I am not talking about bubble packs interfering with repeaters. As you noted bubble pack radios are not duplex capable so that is a moot point.

I am happy to hear you don't have a problem with piracy in your area. Great news. But sadly that is not the case in many places. I am talking about pirates ruining simplex operations. Most GMRS users do not use repeaters. I have no use for one. My base station gives me a 13 mile range with my ICF21, and that covers my needs. If I find someone in the future who wants to share costs, and it would be of some use to me, then fine. What we have here is typical family simplex users, who have a hard time finding a clear channel due to jammers and pirates. I also know that many areas of the country have the same issue.
It is easy to understand why people would feel GMRS is headed for freeband status. Actions speak louder than words. Allowing Garmin to make the rino so that it transmits data on GMRS frequencies was an obvious sign they don't even respect their own rules. Mark my words, it may not be tomorrow, or next month, but this band is headed the same direction as CB unless something changes.

When you have more illegal users than legal users on a band, that is a pretty good sign that there is a serious problem.

Just because it doens't directly impact you, or your area YET, does not mean that it is not an issue. You will feel differently someday when audiovox and the others start releasing $20 pairs of DUPLEX bubble pack radios (God help us). But it will be too late, and it may already be too late to change the course of future events. Oh well, there is always MURS, which you can't buy in a bubble pack.

OK - so your source is not a responsible authority - thought so...

>>...enforcement of this band is nearly non-existent...

I live in the most populous region of the nation's most populous state, and we're getting along just fine on the GMRS. When problems arise, they are taken care of. There has not been ONE documented case of a FRS unit interfering with GMRS repeater operations. And since most of the consumer-grade GMRS radios are not repeater-capable, they are not posing a problem for GMRS repeater ops, either.

On the very few blatant problems when the FCC has been needed, they have responded appropriately.

I agree that most are unknowingly breaking the rules due to the things I have already mentioned. And for practical purposes contacting them and educating them does the most actual good. Of course you know you are breaking the rules by talking to an unlicensed user, but common sense dictates that your approach will have the most postive impact. I am completely against filing complaints, except as a last resort, when someone chooses to be a pirate. I have run into two operations that I had to file complaints on, and both were completely OWNING a frequency, and both were operating outside of the law, and were unlicensed, both businesses. I had no choice. But overall, the FCC does not need a gazillion complaint forms to deal with. They just need to start enforcing the few that they do get regarding GMRS.

With all of this said, I'll bet you won't find too many Ham operators who feel the same way about their band. If they caught people operating without a license on THEIR band you can bet it wouldn't be a friendly exchange, and complaints would be likely. But of course GMRS is a unique situation where retailers and manufacturers have been less than forthcoming regarding information on licensing requirements in the past, so we have to cut people a little slack. Agreed.

But again, the FCC is partly responsible for causing this whole mess to begin with, and I am less than happy with that, as are many others.

12299. LMR UHF Radios for sale

Yahoo group: GMRS (2005 — 2007)
Date: 2007-01-27 00:49:19 UTC
From: kc8ddq@aol.com
Topic: 12299 Message: 12299

Hey everyone,

I have 2 UHF Land Mobile Radios for sale. One is a Uniden Force FMU-250K. It is in excellent condition. It only has 2 channels programmed into it right now. I was going to send it off to get it programmed for GMRS but never got around to it. It has a power cord and microphone but no mounting bracket. The other radio is a Midland SYN-TECH UHF transceiver. It is in excellent condition. It is currently programmed with 30 channels consisting of GMRS simplex, GMRS repeater pairs, and FRS. It includes the microphone, mobile mounting bracket, operators manual, and power cord. Pictures can be provided if you wish. Asking $75 each plus shipping. Please feel free to email me if you have any questions.

Thanks
Paul

Interesting - my understanding was that a licensed GMRS operator _could_ communicate with an unlicensed FRS user as long as the licensed operator properly IDs. (Since FRS users are not entitled to operate through repeaters, that is not under consideration here.) I don't have the rules in front of me but that was my understanding.

We CAN communicate with FRS users. The FCC clarified that a while ago. Details are available on my site here:

http://rayvaughan.com/gmrs.htm

It's in about the middle of the page.

Kevin, you are right. Licensed GMRS ops can talk to FRS ops on GMRS shared freqs. The key here is that the FRS ops must only be at 500mW while the GMRS ops can be at 5W (I am no worrying about PEP vs ERP here). If an FRS (unlicensed) operator uses a combo bubble pack with power output at high (greater than 500mW) on his FRS shared freqs then he is TXing illegally. The GMRS op is OK as long as he IDs per the rules. Remember that the rules are applied for both freq and power. Some combinations are legal while others are not depending on whethger you are talking about FRS or GMRS.

Interesting - my understanding was that a licensed
GMRS operator _could_ communicate with an unlicensed
FRS user as long as the licensed operator properly
IDs. (Since FRS users are not entitled to operate
through repeaters, that is not under consideration
here.) I don't have the rules in front of me but that
was my understanding.

12309. Bubblepack Definition

Yahoo group: GMRS (2005 — 2007)
Date: 2007-01-26 14:03:11 UTC
From: jmarcel66@comcast.net
Topic: 12309 Message: 12309

For the purposes of this forum, is the term "Bubblepack" meant to describe the FRS radios that also cover GMRS and nothing more? (I.e. the Rad Shacks, Midlands, Garmins, etc).

Many of us up here in New Hampshire have sort of adopted the phrase to mean "All" of the preprogrammed portable radios including the FRS/GMRS; but also the UHF/VHF XTN type series commercial (losely used term) portables. Pretty much any portable that comes prepackaged, often available as Rad Shack, Sams, Walmart or similar and has the ability to set the frequencies from the preprogrammed list.

The Illgeal use of the business frequencies has actually surpassed the GMRS abuse up this way dramatically. You get the family or business that occasionally ventures into Channels 15-22 on their "Family Radios". But the actual "IG" Business band is overun up here w/unlicensed users, all w/their commercial (losely used again) bubblepack radios. BTW, I found these radios do not typically have GMRS or FRS in their available list of frequencies. The VHF ones do have the MURS frequencies.

I guess a couple levels of thought here is the proliferation of all these Bubblepacks (or preprogrammed) portables in the GMRS and now Business bands is really tucking it to legitimate users across the board. And maybe, just maybe, the commercial bubbles will deflect some illegal users from GMRS. Either way, it's not a true fix for anything.

On a positive note, Two sets of neighbors independently purchased some FRS/GMRS Bubbles for Christmas and both (w/out my saying anything) told their kids they must stay off of Channels 15 to 22 unless Mom and Dad get a license. There's a few honest folks left.

Actually, it's been done, just not a commonly seen bubble pack.

The Motorola Talkabout 7200 has repeater mode available, but I never saw them sold locally here in San Diego. I believe they've been discontinued for now, at least they're not available from Motorola's direct sales site. They were, however, sold as a pair for around $90, I believe. The 'standard' 38 CTCSS tones, more DCS codes, and inversion scrambling allowed.

No worries about the bubble, he won't be able to enter 254.1 for ctcss into his bubble pack anyway. He would need a commercial grade radio to do that. Not to many moron jammers / pirates spring for the real thing.

Heh. You might *think* that would work. How long before "joe jammer" records the audio from your DTMF tones on the input (using a scanner or otherwise) and then replays that through his bubble pack radio?

...sorry, didn't mean to "burst your bubble..."

From: Michael Ormandy
Topic: 12309 Message: 12312

I define them just as the name implies, they come in a blister pack. Commercial grade radios still come in cardboard boxes, with packing materials. It is not about being pre-programmed though.

I have an ICOM ICF21GM that is preprogrammed, but it is no bubble pack. Check out the sensitivity and selectivity specs for starters. Then check out the solid, bulletproof construction, good quality removeable antenna, the duplex capability, and the ERP which is better than any of the bubble pack radios. Also a big difference is having a 1650mah nimh battery pack that lasts for days and can be replaced in two seconds, and a rapid charging cradle that rapidly charges the battery to a decent state, then reverts to a trickle charge. It also can use non-standard CTCSS codes that bubble pack radios cannot use. Best part is, it was $90 on ebay! Not much more than a two pack of the better bubble pack radios with charging kit. I can talk to my base station from 12-13 miles away, and my bubble pack radios cannot talk to the base station at that range, because they are not the same level of radio. Besides the annoying plastic packaging, sensitivity and selectivity are the two most
telling factors in my opinion, when it comes to defining the difference between a "bubble pack" radio and radios that are on the next level.

12313. Re: [GMRS] License requirement

Yahoo group: GMRS (2005 — 2007)
Date: 2007-01-26 12:18:55 UTC
From: kvsp1160@aol.com
Topic: 12289 Message: 12313

I honestly think that this is a great point to make to the FCC (PRA or whoever else) regarding the licensing issues. Already, a very low percentage of people send in their $80 to get their license for a $20 bubblepack radio; which really doesn't make much sense to begin with.

I agree that if the equipment being used for GMRS exceeds a certain wattage limit, it should be required to have a license associated with it, regardless of it being simplex or duplex, antenna height, base, mobile, or handheld. FRS/GMRS interstitial freqs was a joke to begin with. Most only use the 14 FRS freqs, and others use both - all a large percentage without licenses.

I truly think that Ray's idea will pass. If the wattage exceeds 3.99 watts (4.0 - 50.0 watts), then it is required to have a GMRS license issued in your name. Period. No matter what GMRS freq you are using.

Any way we can send this in legal (official) writing and make sure that it gets to the right people?

From: jmarcel66@comcast.net
Topic: 12309 Message: 12314

I guess that does help define for me better the difference. And in looking at the Icom, we'd never confuse that with a "Bubblepack" radio. But looking at how I wrote it, the Icom could be implied.

What we've considered bubblepack is exactly as you described. What I wondered though is did folks here consider Bubblepack only FRS/GMRS or were the Business Frequency models like the Motorola XTN Series at Sams included in that generalization too. I would say yes, but probably an XTN won't see the chat time here because they're not GMRS related (usually). .

I appreciate the corrected and honestly far better explanation than I had.

What I was getting at originally, was that it is technically against the rules for a licensed GMRS operator to talk to a GMRS pirate. Of course there is not problem talking to a FRS user, so long as the GMRS user is following the other rules.

There definitely are business band bubble pack radios. These are not commercial grade radios, and come in bubble packs, so the definition fits. You can't touch a "real" moto HT for 100 or 200 dollars.

I honestly think that this is a great point to make to the FCC (PRA or whoever else) regarding the licensing issues. Already, a very low percentage of people send in their $80 to get their license for a $20 bubblepack radio; which really doesn't make much sense to begin with.

I agree that if the equipment being used for GMRS exceeds a certain wattage limit, it should be required to have a license associated with it, regardless of it being simplex or duplex, antenna height, base, mobile, or handheld. FRS/GMRS interstitial freqs was a joke to begin with. Most only use the 14 FRS freqs, and others use both - all a large percentage without licenses.

I truly think that Ray's idea will pass. If the wattage exceeds 3.99 watts (4.0 - 50.0 watts), then it is required to have a GMRS license issued in your name. Period. No matter what GMRS freq you are using.

Any way we can send this in legal (official) writing and make sure that it gets to the right people?

12319. How does everyone here ID?

Yahoo group: GMRS (2005 — 2007)
Date: 2007-01-30 15:41:26 UTC
From: Craig
Topic: 12223 Message: 12319

We have a business here that uses a 'bubble pack'
radio but on a main (462.600) frequency. Now that's
not legal is it???

Only if they were licensed before the 1988 cutoff, and if they identify, and if they do not in any way modify anything from what was on the original license.

12321. Re: License requirement

Yahoo group: GMRS (2005 — 2007)
Date: 2007-01-30 21:16:59 UTC
From: tlasken1
Topic: 12289 Message: 12321

I'm glad to see there is a movement for enforcement. It is interesting that the abuses were totally predictable from the outset due to the way the FRS and GMRS services were implemented in the Regulations.

I wonder how much manufacturers influenced the Regulations. They could care less about enforcement, but whatever will sell more radios, including predictable illegal use, is what does motivate them. No doubt their voices are loudly heard during the comment phases.

They would be legal to talk on 462.500 (also a repeater output freq), with up to 50W IF:

1) If they were licensed before the 'individual rules' went into effect AND have kept renewing their license.
They would be bound by the terms, assigned frequencies, base locations, number of units, etc.
as stated on their original 'authorization letter (the 'license').

-or-

2) Each user has an individual license (and individual license allows the licensee to authorize use
to specific family relations (not all relationships are valid - see the FCC rules).

Nothing in the FCC rules prohibits business use of either FRS or GMRS (new individual licenses or
maintained older -- 'grandfathered -- license. The fact that it's a 'bubblepack' radio is irrelevant
as long as that radio has an FCC acceptance for use on GMRS.

Yes and businesses do use FRS and MURS. If I was really nasty I could change people's drive thru orders at my local KFC because the head phone system is MURS based. This would of course constitute harmfull interfernece so . . .

In fact my local Walmart uses FRS in store, they certainly sell enough of the things.

I do like the sound of this dialogue and some of the definitions coming out. Positive change instead of negativism, that's good.

Yes, you can get that kind of performance. Remember, at these freqs (462MHz) everything is line of site. You will need height above the average terrain. You will need more power in the mobile than in the base. Everything is in your antenna. Use high quaility (low loss) feed line and tune your antennas for lowest SWRs possible.

1) If you're talking MURS, you're presumably wanting to use this for business. If it's not 'all in your family', GMRS is no longer a business service, so you should consider that. A 'real' business should be investigating local business communication services, with proper repeaters and such.

2) Range is very tricky to figure reliably, but, the 'rule of thumb' for range is Range in miles = square root of antenna height in feet, for VERY reliable range. Remember to add the miles from BOTH ends, that is, if you have a 25' base antenna, (5 miles), and a mobile at 4', (2 miles), your high reliability range is 7 miles.

You will routinely get double that range, at times, for 14 miles, but you can't be strongly sure of getting that. You may well get even a bit more.

Of course, if your base antenna is 25' above ground, and said ground is at an altitude of 100 feet, at the top of a hill, the real range is from the 125', or 11 miles.

All this is direct comms, and if you really need 15-25 mile range on GMRS (or business frequencies), you probably need to install a repeater somewhere on high ground that looks 'down' on the area you need to cover. Any GMRS licensee can put up a repeater, though you should be consulting with all other local users, especially repeater operators, before installing one, to prevent causing interference to already present ones.

I don't doubt you, but you must be on high ground with one or both of the radios when doing that. I should have noted that what I said applied to level ground, with minimal obstructions.

UHF is line of sight. With an antenna 10 foot off the ground your line of sight is 7 miles on level ground, when talking to a radio antenna that is 6 feet off the ground.

UHF signals do not penetrate the earth, and do not bend much. They also do not skip. So a 15 mile range on level ground with a 10 foot antenna height is not possible under typical conditions, unless one or both of the radios in question are higher than surrounding terrain.

10 more feet of height would only give you a nine mile line of sight by the way.

My equipment is top notch, with a tuned base antenna with less than 1.2 SWR, 50 watts, and over 6db of gain, with a 5/8 wave collinear design, and can not quite do 13 miles, and that is in a direction with flat desert terrain and few obstructions, or in any other direction. Keep in mind the antenna is 40 feet off the ground, and very low loss cable is used. The calculator shows line of sight at a bit over 12 miles, so that makes perfect sense, the signal goes until it hits ground, and no further.

This link is a line of sight calculator that comes in handy when figuring range. Check out how tall of an antenna is needed for a 20 mile range, 150 feet! To have a 30 mile range your antenna needs to be almost 400 feet off the ground! To double the range from 20 miles to 40 miles you need to go from 150 feet high to 700 feet high!

Yahoo group: GMRS (2005 — 2007)
Date: 2007-02-01 14:44:39 UTC
From: Michael Ormandy
Topic: 12325 Message: 12338

With both radios on fairly flat ground, you will probably NEVER see 14 mile range with UHF, given a 25' antenna height. That is virtually impossible, given that the line of sight is only 10 miles. Remember, UHF signals do not bend, skip, or penetrate the earth. With an excellent setup and a 40' high gain antenna, on pretty flat ground I can't get that range, in any direction, ever, although I can get close. That is because I am limited by the same thing everyone else will be, the earth's surface.

When it comes to UHF range remember, antenna height, line of sight, antenna height, line of sight, antenna height, line of sight. Just keep saying that to yourselves. UHF does not reach over the horizon. Period.

Google "line of sight calculator", put in the two antenna heights, and you will know what is POSSIBLE under ideal conditions. You will not exceed this distance with UHF. UNLESS one or both of the radios is on high ground, which effectively changes the antenna height above the surrounding terrain.

Murs is limited to 2 watts, and you are not going to get much power out of an antenna with a long cable run with a 2 watt transmitter, so it will not have the range of GMRS because of this. Forget about MURS if you want that range. GMRS is the way to go, and again, the higher you get that antenna, the farther your range.

1) If you're talking MURS, you're presumably wanting to use this for business. If it's not 'all in your family', GMRS is no longer a business service, so you should consider that. A 'real' business should be investigating local business communication services, with proper repeaters and such.

2) Range is very tricky to figure reliably, but, the 'rule of thumb' for range is Range in miles = square root of antenna height in feet, for VERY reliable range. Remember to add the miles from BOTH ends, that is, if you have a 25' base antenna, (5 miles), and a mobile at 4', (2 miles), your high reliability range is 7 miles.

You will routinely get double that range, at times, for 14 miles, but you can't be strongly sure of getting that. You may well get even a bit more.

Of course, if your base antenna is 25' above ground, and said ground is at an altitude of 100 feet, at the top of a hill, the real range is from the 125', or 11 miles.

All this is direct comms, and if you really need 15-25 mile range on GMRS (or business frequencies), you probably need to install a repeater somewhere on high ground that looks 'down' on the area you need to cover. Any GMRS licensee can put up a repeater, though you should be consulting with all other local users, especially repeater operators, before installing one, to prevent causing interference to already present ones.

From: kvsp1160@aol.com
Topic: 12325 Message: 12340

I think in regards to GMRS, if you want to use a base system, all you'd need is a good 6dB gain antenna on a 20' tower (or higher) and a 40w radio (either base or mobile setup).

If you want a few mobile setups, a good 3-5dB gain mobile antenna with at least a 35w mobile radio is all you'd need.

My mobile setup consists of a 3dB gain antenna and a 35w Icom F420 mobile. I can hit all local repeaters and all other mobile or HT's within a 8-10 mile radius. And I'm in a valley with hills and buildings. My lines are short, but I concentrate my power to where I need it to go and who I want to talk to.

For my repeater, I had a computer model it's signal propagation with 40w at 310' elev, using a 6dB gain base antenna. My results gave me a maximum radius of over 40 miles in any direction without obstruction to the hills or buildings.

It all depends on what antenna, hardline, and radio equipment you choose to create your setup. The final is the result of your decision. You can view my charts and equipment pics on my website for more detailed info.

Topic: 12341 Message: 12341

Repeater performance

Here is a new subject line ;-)

So far people here have been amazed at the performance of only 10 watts. But as has been said, its in the antenna and the feed line. Very fortunately, a professional company left behind their hard line and antenna. The reflected power is almost nothing. So, the more that makes it to the antenna, the more your gain antenna has to play with.

Browsing the FCC Type Acceptance lists, I find that they're ignoring their FRS rules regarding data again.

Equipment Authorization number LU9337966 from MGA Entertainment (HK) Ltd. is for a two channel (462.6625/462.6875) handie talkie with either ordinary voice, or 'SMS' type text messaging option, with a cell phone type control panel with icons, etc. to do the text messaging.

Guess we'd best expect that ANY type of use is going to be authorized (eventually) on FRS, and by the willingness to Type Accept dual use FRS/GMRS units, on GMRS as well, in time.

Well just to let you know the Ritron repeater is still for sale as I had some calls but no takers.

Also I have a Motorola repeater for sale. It is a R-100
I think it is a 10 watt unit but it may be more. Right now it is set for 8 watts as it goes into a 50 watt pa. The repeater at this time is programmed for 462.725 and is DPL 125. Asking price is $225.00 but that will also cover shipping in the 48 US only. At this time this repeater is in operation and a good working unit. The 50 watt pa is not for sale.

thanks John

12346. Duplexer Help

Yahoo group: GMRS (2005 — 2007)
Date: 2007-02-05 02:11:03 UTC
From: kvsp1160@aol.com
Topic: 12346 Message: 12346

Hi Everyone,

I have completed my repeater system, except to find out that I have a huge signal loss in the system. I tracked it down to find that it's in the duplexer itself. Found out that the cabling inside was all messed up and needed to be realigned... Long story short, here's what I need:

- Original schematic wiring diagrams for the Decibel Products DB-4072 (have tuning guide).
- OR a duplexer for sale (band, notch, or both).

If I do buy another duplexer, my current one will be for sale (or can be used as a trade).

Any help would be greatly appreciated.

From: Walters
Topic: 12325 Message: 12347

MURS will not do what you want as power is limited to 2 Watts and NO REPEATERS. GMRS is your only hope other than HAM. The "as-the-crow-flys" or line of site distance is the only number that counts with as much height as you can get.

I83 runs almost due north/south in York County PA. My repeater is at mile 4. I can hit the repeater and have a converstaion from exit 16, that's 12 "drive" miles. Straight line a little less but the point is my 10 watt repeater makes the trip fine and I am using an IC-F21GM 4 watt handheld hooked to a nice gain mobile antenna from the car. True, it does not work in the valleys, at all, but on the hills it is great.

You can setup a 45 watt base and 45 watt mobile for max power and probably make the trip. But a repeater somwhere in the middle would be better. A nice high antenna and each unit would only have to go 6 or 8 muiles and you would not need as much power on each end. Put the repeater closer to home and someone there could probably hit it with an HT and then a good mobile unit for your car.

Well, just my thoughts. Others may have better ideas.

Does the FCC have any restrictions on Scrambled and/or Digital Voice on FRS/GMRS? I ask because the local football team uses headsets on FRS which is scrambled using a PL. The company advertises the system as a Digital simultaneous continuous open line system on the air (or hardwired). The one used here isn't an open line. Nor is it digital or simultaneous.

The company is http://www.portaphone.com/. It's kind of funny to me they go on about secure communications, but they chose the most available set of frequencies in the land to use.

Murs with 2 watts is not going to do it. Just not enough power to send up a long feed line.

GMRS with a 60 foot high antenna should give you a 14 mile range. That may work in your case. Check the air distance on a map.

From: Richard Hayman
Topic: 12325 Message: 12350

Use a repeater. I have two well located repeaters. Range is about 17 miles on each to 25 watt mobiles with good reliability. Sometimes I can get 30 miles but that's rare. One repeater is about 150 feet up and the other is on a mountain top - elevation 1750' on a 100' tower. Repeaters are 35 miles apart.

Count on 40% of that distance to handhelds.

Portaphone has several systems. The FRS one is a plain old push to talk FRS system, with inversion scrambling, thus, not 'secure' in any way, given all the other inversion scrambling FRS units available. Since all those FRS units were type accepted with inversion scrambling, presumably the FCC ok's it.

They try to call CTCSS 'secure', but all they mean is that you're secure from recieving interference. Not all that true, actually, if the stadium is full of families using GMRS/FRS HT's at full power.

The full duplex Portaphone coaches system is spread spectrum at 902-928 MHz, secure enough for coaches, unless the NSA wants to intercept.

They also have a system at 2400 MHz.

Had I known about them before I went to the games, their website would've clued me in to at least search there as one option based on the style of some of their advertised radios looking like bubblepack (got the big channel number and little privacy code/PL number).

However, I know this because I was at the games and searched until I found it. I suppose it could be said since it was scrambled, how did I know it was them? First there wasn't any other use in the area. Then when I found the frequency, I watched the coaches talk. When they talked on the radio, the frequency was active in scrambled mode; when they stopped the frequency activity stopped. Then I researched the company on their radios and determined this is it.

I do need to correct myself that they have advertised "Scrambled" communications in addition to their digital systems. The oddity out here is the system is scrambled as they describe. But they use the black box w/antenna described in the digital ad portions, not the bubblepack looking or Kenwood portables. I suppose you can get the system in whatever configuration you want. between headphones, radio styles and whether digi or scrambled.

Must correct myself, the rules HAVE changed on this.

For FRS units, the following is now the rule on emission types:

(d) An FRS unit may transmit only emission type F3E or F2D. A non-
voice emission is limited to selective calling or tone-operated
squelch tones to establish or continue voice communications,
digital data transmission of location information or text messaging.

GMRS, on the other hand:

(a) A GMRS transmitter must transmit only emission types A1D, F1D,
G1D, H1D, J1D, R1D, A3E, F3E, G3E, H3E, J3E or R3E. A non-voice
emission is limited to selective calling or tone-operated squelch
tones to establish or continue voice communications. See Sec. 95.181
(g) and (h).

So, a purely text messaging handheld 'FRS' unit is within the rules,
now, should anyone wish to sell one.

12359. GMRD Repeaters

12361. IC-F21GM

Yahoo group: GMRS (2005 — 2007)
Date: 2007-02-09 22:56:35 UTC
From: Mr. Ed
Topic: 12309 Message: 12361

I picked up an IC-F21GM a couple days ago and have a few questions.

In carrier squelch mode I found I had to turn the squelch almost all the way up. Is this normal? At first I thought I had some local UHF QRM but even out in the wilderness I have to turn the squelch way up (unless the interference is coming from my wristwatch).

Second, is there any way to have the radio transmit a selective squelch tone but receive using carrier squelch?

Mr. Ed

Michael Ormandy wrote:
> I have an ICOM ICF21GM that is preprogrammed, but it is no bubble pack. Check out the sensitivity and selectivity specs for starters. Then check out the solid, bulletproof construction, good quality removeable antenna, the duplex capability, and the ERP which is better than any of the bubble pack radios. Also a big difference is having a 1650mah nimh battery pack that lasts for days and can be replaced in two seconds, and a rapid charging cradle that rapidly charges the battery to a decent state, then reverts to a trickle charge. It also can use non-standard CTCSS codes that bubble pack radios cannot use. Best part is, it was $90 on ebay! Not much more than a two pack of the better bubble pack radios with charging kit. I can talk to my base station from 12-13 miles away, and my bubble pack radios cannot talk to the base station at that range, because they are not the same level of radio. Besides the annoying plastic packaging, sensitivity and selectivity are the two most
> telling factors in my opinion, when it comes to defining the difference between a "bubble pack" radio and radios that are on the next level.

Steve,
If you belong to the MidlandLMR group, the Titan programming software (along with the programming manual) and the Titan user manual (which includes the pinouts) is located in the files section.

If you are not a member of that group, contact me direct (kc0fwn@...) and I can send them to you.

The squelch thing is normal, it is ultra-sensitive and picks up any type of noise out there. This radio is meant to be used with pl codes, in my opinion. You can't just use the codes one way, this radio is not THAT flexible. Good radio though once you know it's limitations. That sensitivity really helps it work at awesome ranges.

I figured out the abnormal high squelch setting. I'd misread the manual and only thought I was setting the squelch very high. I also found a UHF source of QRM near the comfy chair where I was doing most of my experimenting.

As for the selective squelch, it appears that if I press and hold [MON] it will put the radio into Audible Condition which appears to be carrier squelch mode while still transmitting a ctcss tone.

This is a great little radio. Some bits of the manual are a little misleading but overall it's a very nice radio.

From: Just ask me~
Topic: 12366 Message: 12366

Hello.
I am new to the group. I have a few questions, and maybe somebody out there can help me out. I have read many posts, so I know the KNOWLEDGE is here in this group. LOL

I am looking to purchase a 2-way radio/cb or walkie talkie system to be used locally in my area for 20 mile courier service.
Does anyone have any suggestions or advice on which to purchase?
I need a good signal strength of course, I looked into the 2ways at local electronic stores, they just seem so "cheaply" made and most I understand won't go over 2 miles, regardless of what their claims are.

Please help. I am looking to begin this in early March 2007 if possible.

Thank you kindly in advance,
Becky

Larry,

If I were you I would look up that FCC-ID on the FCC's web site.
Unscrupulous sellers have been known to put a bogus label on non-approved
radios just to make a sale.

What is the FCC-ID that is one the GP-68 radio that you have ?

Hi Becky,

Others here can help you in choice of equipment... However if you are starting a business or will be working for a business and you expect to be "dispatched" via two way radio you should get a busines license or your employer should do so. If you just need to stay in touch with family, while you are working, then General Mobile Radio Service is just the thing. License will cover you and your family. But remember at least one of you needs to be on high ground if you don't have clear line of sight. Either "home base" has to be on a hill or use a repeater system.

BTW if you choose commercial grade UHF radios you can legally put both business & GMRS freqs in them.

Hope this helps

Mary

I'm going to throw some things out here that may cause some heartburn among some readers.
Cell phones are pretty good, but at $30-40 a month per radio they can get expensive, stiil they are an option.

I've got another idea:
There is a two-way radio company here that offers two-way service for businesses and it covers a huge area with linked repeaters that a 4-5 watt handheld can reach from anywhere in it. The cost is $11 per month per radio. No license needed, all you need is a pair of radios and they will do the programming. This kind of radio service would be great for a delivery service. And if $11/month/unit is too much, then you need to find another way to make a living.

GMRS is not supposed to be used for business purposes, but putting that aside, you would need a repeater and all the expenses that go along with that as well as the time involved in setting it up and running it. Then you would need a pair of radios as mentioned above. But the real headache is finding a good antenna location. I'm going to guess and say that you probably need to be at least 100 feet up. It depends on where you live. Around here, you need to be that high to get over the trees which really degrade a UHF signal.

Unless you "know somebody" the rent on that kind of antenna space can get very pricey very quickly.

I just don't think GMRS is practical for you.

Mary,

As far as the keypad thing is concerned, I haven't seen any rules in the old 1996-98 and the new 2005 (considered current) for Part 95.

Keypads are very useful when programming repeater controllers and other equipment in the field. Especially if you don't have time or direct access to your repeater site to change an error or detail.

They also come in handy if your radio has a built-in paging feature (95.181-h), or to recall the frequency/channel/tone.

I have looked into this, and am pretty certain that keypads are welcome in the Part 95 service. Nothing stated otherwise for todays rules. Maybe in the past rules, but those are non-existent and are not used.

Motorola originally intended the GP-68 to be for sale worldwide. However, MANY of the US dealers revolted at the thought of a radio that was (at the time) 1/3 to 1/2 the price of the rest of their 'professional' portable product line.

The end result is that Moto DID NOT did not submit the FCC acceptance application - hence it's not legit to use or be sold in the US. The GP-68 is (or was ?) sold in Asia, and is very popular. It is a pretty good radio for the buck - much better than the typical consumer grade ('bubble pack') radios and significantly less expensive then the like of the 1250.

There were a very few promo radios and very limited stock that was certified, but under a different model number for intro to US dealers - but... I've heard it was only a few hundred units.

I do see a lot for sale in the US, but they are not legit FOR sale.. I don't even believe they have a part 15 acceptance for the recover side of the radio, and therefore are not even legal for sale or for amateur use.

I've seen a few with bogus FCC-IDs on them.. some with a FCC number from a Uniden FRS radio.

That said, you can find accessories like batteries readily available for some on-line and e-auction sellers. Do a Google search, as well as an eBay search, for the GP-68... last time I did that, I found quite a few for sale.

Hi Frank,

I knew this would stir up a stink.
The early GP68's were type accepted with a part 90 designation.
We have all seen the posts and threads about this and I don't intend
to rehash all of that. Suffice to say that most part 90 radios are
legal on GMRS

The radio has a legitimate label on it and I don't have any doubt
about it's authenticity. From the factory they are not programmable
from the keypad without being modified(removing a resistor).I have
made that modification because I use this radio on the 440 ham band
and I don't have any reason to operate where I don't belong.
If someone wants this radio without the keypad programming, I will
put it back stock.

For a previous poster, the GP68 is a UHF handheld radio with 4 watts
output, 20 memory channels,scan, lcd display, both pl and
dcs tones, 430-450 MHz.

Cheers

I believe you're looking in the wrong part of the rules. Part 95 is for us users. Not manufacturers. I think the technical specifications required to achieve type acceptance appear in a much lower section of the rules. I believe that's where user (aka Front Panel) programming is disallowed. Part 95 just requires us to use radios that are type accepted for Part 95. I'm sure someone here can point us to the exact R&R Part.

While I'm with you on being able to program some things, like PL, I don't want to see radios that allow the RF parameters to be programmed. Other than honesty, what prevents you from programming the radio to my 461 business channel? Or my department's 460 Public Safety channel?

That's why many of us got Radio Telephone Licenses back in the day. Once upon a time, we were the only ones legally allowed to work on transmitters. With our license on the line, we wouldn't program (or crystal) a channel you weren't allowed to be on.

During the era of deregulation, the FCC decided people with MBAs in suits were better than them to determine who should be qualified to work on transmitters. Now my GROL is a handy bit of trivia in my wallet.

Back to the GP-68, I've heard horror stories about how Motorola treats people found to have them in the US. Apparently they were for export only. Even using them in the ham bands (where user programmability is allowed) doesn't go over well with the big M. The tricky part is Motorola gets the US Marshalls to enforce their wishes.

Let me put it this way.
GMRS - up to 50 watts.
MURS - up to 2 watts.
Hmm, I think more power = more range. Height helps too.

Hmm, I think more power = more range. Height helps too.

All that you say is true.

The only additional comment I have is regarding HT radios (Handy Talkies).

If you use a 4 or 5 watt HT on GMRS and you compare that to a 2 watt HT on MURS, the MURS radio might just propagate farther.

VHF (MURS) propagates better than UHF (GMRS). VHF gets more diffraction around buildings and obstacles, and VHF seems to penetrate trees and foliage better.

Also remember that you can use a gain antenna (Yagi) with MURS. Two MURS radios with gain antennas pointed at each other can enjoy a pretty god range, especially if you have some elevation -- hilltop, building-top or tower.

On GMRS, an HT is very limited unless you use a repeater.

From: Lake Hodges Radio
Topic: 1980 Message: 12391

> >>>Tell me about this repeater.

Kenwood TKR-820 desktop repeater set to 462.575 with two PL tones --
107 and 110. It's currently set for 15 watt transmit (for continuous
operation) but can be turned up to 50 watts I believe.

Includes Celwave duplexer professionally tuned to 462.575 by Kenwod Dealer.

Also includes Kenwood hand-held mic, so that the repeater can be used
as a "base" station.

This repeater has an INTERNAL power supply and plugs into 110VAC.

I require proof of GMRS license.

I also have an omni-directional Cushcraft Ringo Ranger antenna (3 db
gain) tuned for 462.5 MHz that has been used with this repeater. AND
-- a 12db yagi tuned for 462.5 MHz that creates a teardrop or V-type pattern.

I also have two ICOM IC-U400 mobile rigs and several ICOM F21GM hand
helds and a couple of small Motorola hand helds, all of which work
with this repeater.

I don't want to give these away but will sell for reasonable price.
Can ship anywhere in US.

Hi and welcome!

First, you need a license. It costs $85 for 5 years, and covers you and your family. You can register and pay for one through the FCC here:

http://wireless.fcc.gov/uls/index.htm?job=home

While you are waiting for your license to be submitted and issued to you, you can review and study the most current rules for GMRS. These are the FCC Part 95 (95.1 thru 95.183), Subpart A. They can be found here:

http://www.access.gpo.gov/nara/cfr/waisidx_05/47cfr95_05.html

Equipment is good to have. If you want to use the full benefits of of what GMRS has to offer, stay away from those cheap bubble-pack radios at Walmart and other electronic stores. They are no good no matter what they claim, and can only transmit a distance of about a mile in the city and 2 miles on the highway at best.

Look for equipment at places like rkleef.com, on the 'radios4sale' yahoo group, or even on eBay. But be fully aware what you buy and be sure that they meet Part 95 specs (it will say on the radio, in the manuals, or can be looked up using the FCC ID on the FCC website).

There's more to GMRS than simplex. ... But I think you should just start with this for now. Need anything else, just ask...

From: Walters
Topic: 12395 Message: 12400

Hello Rick,

First thing Rick is go to this link and get tyour license.

http://wireless.fcc.gov/uls/index.htm?job=home

Then here for the rules.

http://www.provide.net/~prsg/part95ae.htm

Now you have that under you belt you can start designing your GMRS system. Will you be using a repeater? Then all your radios will need to be high quality commercial grade capabale of using the repeater offset. The ICOM IC-F21GM is a good repeater ready hand held unit. If there repeaters around you, you will need to contact the owners and secure permission to use their repeaters. Otherwise you will need your own.

OK, so maybe you don't need a repeater, 5 miles in open terrain is OK for you. Well, the ICOM IC-F21GM is still a good unit but you might want to checkout the inexpensive bubble packs with 5 watts power. They have their detractors, even in this group. But if you do not need a repeater, then combo bubble packs will do the job of covering a few miles in open terrain ioutdoors.

You need the license either way so get on that first.

Have a supply of Kenwood TK-3200U2 kits (11 units)
UHF radios 2 channel 2 watts with chargers. new was ordered for a customer and got them back after we programmed them and ship them.

They all have new batteries, chargers complete will program to 2 GRMS channels and test before shipping.

List $272.00 each

sale price $199.00 each $8.10 shipping per radio when sold each.

thank you,
John

Topic: 12406 Message: 12406

Just for info, in case anyone feels like starting a new one, these are the GMRS repeaters I know to be 'on air' in San Diego County, CA.

Note that ALL of these are private, no travelers/guests, sorry. Rather agressively so.

462.625/467.625 - Limited activity, Seems to be in northern part of the county, used when needed for coverage.

462.650/467.650 - 'YELLOW' - High activity, and you'll find it interesting to monitor - It, and the rest of these, are used by the local news media 'stringers' to keep each other advised of film-worthy activities around the city. There are a LOT of them, and they're very active, especially at night.

462.700/467.700 - Some activity, not a lot.

462.725/467.725 - Very limited activity.

That leaves, locally, 462.550, 462.575, 462.600, and 462.675 'open', but be aware I seem to be hearing a mexican outfit using 467.550 as a repeater OUTput, so it's probably not usable here as an input for GMRS.

I hear no sign of the old 462.675 'React' repeater that used to be operating in San Diego anymore, seems to be defunct.

From: Sam
Topic: 12386 Message: 12409

Bill,

I got my GMRS license a few weeks ago, and live in Central Texas, flat with a few rolling hills. I have 2 40watt mobiles and a 40watt base on a 40ft obgl antenna doing simplex and getting about 25 miles mobile to base and about 8 miles ht to base. Would like to put up a repeater one day, but for now the simplex use is meeting about 80% of our needs. Now if anybody has a repater at a good price it would be hard to pass it up.

Since this radio receives only on 467 MHz, it is not lawful to use as
a base station in GMRS.

From: Ray_Vaughan_99
Topic: 12412 Message: 12412

Moderator here...

I've let some for sale ads go on this mailing list recently. But this could get out of control real fast.

Going forward:

If you have something legal for GMRS to sell, go ahead a post it here once. Describe it, have a link and e-mail for more info, please include a price. Please include a statement that is IS certified for use in GMRS under Part 95. Even better if you can include a link proving that. If it's not certified, sell it somewhere else.

If you have a question about something for sale, please go direct to the person selling it. If you don't want to buy it, don't buy it. There's no need to comment on the item if you're not the one selling it.

Please, no cross posting ebay ads. Sell here, or ebay, not both.

Of course, I take no responsibility for anything bought or sold here. You're on your own. Buyer beware, all that jazz.

Thanks

12413. Pryme PR-460 Repair

From: Ron DiProfio
Topic: 12413 Message: 12413

Hello GMRS Group,

I own a pair of Pryme PR 460 radios which have become defective. They both remain in transmit after the PTT button is released. Pryme (ADI?) no longer services these radios. Does anyone know where or who might service this radio.

Thanks,
Ron

12414. Re: [GMRS] Pryme PR-460 Repair

Yahoo group: GMRS (2005 — 2007)

From: kvsp1160@aol.com
Topic: 12413 Message: 12414

Hi,

I own a few myself. I've done some self tests and repairs on them, so here's what you could start with: Take apart the casings and remove the rubber PTT button and clean it (wash it with soap and water), and then all contacts with a very damp cloth. This will get rid of all grime and dirt that has built up behind the button from excessive use and wear over the years. (do not apply water or any chemicals directly to the radio itself)

There's also a way to reset the radio, but that means loosing the programming as well (you'll need a programmer). Not recommended unless you know how.

The last solution is to try to contact Bob Leef at www.rkleef.com. He knows, programs, and has sold these radios for a while and may be able to help you better.

My PTT button doesn't need to be pushed in all the way and it transmits with just the touch. So it may be dirt that's holding the contacts together.

Good luck and 73,

The MT2000 is [almost] the same as an HT1000. Conventional only.

The MTS2000 is more closely related to the MTSX series which is
trunking capable.

Why do you ask?

Topic: 12413 Message: 12417

The reason I asked was that I recently purchased a couple of MTS2000's and I ordered a User manual for them. The user manual I received is for a MT 2000 not the MTS 2000 and I was wondering what features I would not be aware of. I also own a few HT1000's and really like them. I have been programming the HT1000's and now I am going to program the MTS2000's. I have two versions of the program and I am not sure which to use. One is version R02.00.01 the other is R06.00.00.

If you do not feel comfortable with just your authorization being in the ULS data base, then make a printout of the page from the FCC's ULS page for your GMRS authorization. Carry the printout with you.

What you will NOT be getting is a 'license' like hams get for the Amateur Service (a wallet size card and a 4x6 card to frame and hang in the radio 'shack'). What you WILL be getting for GMRS is a "Letter of Authorization" on FCC letterhead showing your name, mailing address, call sign and start & expiration dates.

Once your call sign appears on the FCC's ULS database, you are licensed.
You do not have to wait for the paper to arrive.

The FCC changed the definition of 'licensed' about a year ago to mean you're in the data base for the service noted - not that you have the authorization letter in hand. This is a tough concept for a lot of people to grasp in that your whole life you carried your 'license' in your wallet to prove you are legit. It's going to be a real problem with local law enforcement who will also not believe that you do not need the paper to be 'licensed'.

Actually, the FCC word for licensed is 'authorized' - which is more in keeping with the paperless process.

Swannie,

You NEED to get yourself a copy of the GMRS rules and familiarize yourself with them. They aren't difficult and will keep you out of trouble. Check with PRSG.

GMRS uses plain English. No codes or abbreviations is the norm. Identification is important - every 10 minutes and at the end of your conversation.

Depending on where you live there may be a repeater you can get permission to use. That in itself will extend your range for up to 50 miles or so depending on terrain.

GMRS is not a toy and frivolity is frowned upon. There are other radio modes that you may prefer to go to if you just want to play (LOL). I recommend Citizen Band radio (CB) which is sometimes more output power and frivolity is abundant. GMRS radio is often a stepping stone to amateur "Ham" radio and is used for disaster preparedness by many users.

I wish you well and happiness with your new license and radio.

Ed

In addition....
GMRS is for personal, short distance, communication.
SOME systems are limited in how you use them. Some are set up for only quick contact or short conversations and are mainly used for emergency communications. Especially if the system is set up by an organization such as REACT; Mainly on 462. 675 & 462.575 with the 141.3 tone.

How you communicate on a repeater is up to the owner/ trustee weather you use 10 codes or have long converstions. Listen to how others on a system communicate to learn what is the norm on the system.
There are a few GMRS systems set up for chit chat. The Verdugo repeater in SoCal is one such repeater.

From: Mary Hicks
Topic: 12196 Message: 12424

If your license is showing in the FCC online database go ahead and use your license to communicate on GMRS.

Basic rules of GMRS
Identify with your callsign every 15 minutes and at the close of each conversation.
You may use any tactical call (name or unit #) to establish contact.
Common accepted practice on most systems is to say the name or unit # of the person you are calling, short pause, then your own name or unit number.
Last three numbers of your call sign is common on most systems as a tactical call.
10 codes are ok but no "coded" messages. ie using cyphers or other means to hide the true meaning of your message. It is accepted common practice to use alapha names or nick names in refering to other radio frequncies that are restricted (private use repeaters)
Commonly understood pharses (lol etc) are ok.
As with all two way radio services you must give priority to emergency communications.
No use of obscene language.
No broadcasting or one way transmissions.

Paging: When paging another unit if you do not establish voice communications you must clear your digital transmission with your callsign... otherwise it is considered unidentified or one way transmissions.

Power output limits: 50 watt ERP, exceptions: 5 watts max on first 7 FRS/GMRS shared frequencies; (FRS is limited to 1/2 watt unless you have a GMRS license)
The accepted practice is to only use the amount of power needed to communicate effectively.

Repeater usage:
Obtain permission of the owner/ trustee before using a repeater. In some areas it is common practice to access the repeater and call for a control operator who can assits you in obtaining permission to use the repeater.
Repeaters are accessed by use of a sub-audible tone. (sometimes caled pl tone or privacy code)

Let us know your state and general area where you live and someone on this group can tell you if there are any repeaters in your area and who to contact in order to use them. If you are in the SoCal area you may go to SoCalGMRS.org and follow the link to obtain acess to the Verdugo repeater. Even if you are not in SoCal there is an online chat on the website that is active on Wed evenings at 8 PM Pacific Daylight Time. No password needed just type in the user name you wish to use and you can meet n greet

other GMRS users.

If you have one of those "bubble pack radios" most are not capable of repeater access and most only get a few blocks to a mile range depending on the line of sight range. You will want to obtain quality radio equipment from a reputable dealer.

Enjoy

Mary

From: Walters
Topic: 12196 Message: 12425

Welcome Swannie_22,

Here are the rules.

http://www.provide.net/~prsg/part95ae.htm#95.1

You need to give your call sign every 15 minutes during a long conversation but always at the end. HAM radio requires a 10 minute ID Interval, GMRS is a bit longer. You may use GMRS for your own personal use including leisure time, persoanl business, etc but never as a profit making venture. You cannot do communications for hire. You can certainly use phrases like "aka" and "LOL" as abbreviations for things but the use of 10 codes and other coded transmissions have really diminished since the big diasters on 9/11 and Hurricane Katrina. The reason for this is that various codes don't always mean the exact same thing in different places. If you develop a code language in the area around your home but then go to another geographic location for any reason, people will not know your code. Transmissions should always be clear and understandable. This is not as critical during leisure time radio use but the Department of Homeland Security has spelled out very specific rules through the use of the National Inccident Managemnt System how communications are to be carried out during any type of emergency whether it is great or small. I think what people are saying is that it is better to start off using good radio etiquette now as you are starting out so that you do not learn a bunch of inappropriate behaviors now that you have to get rid of later. Trust me, you will still have lots of fun.

Due to he frequencies used, GMRS and its little brother FRS carry through buildings pretty good. This means that someone inside a building can still talk to some outside or someone else on a different floor or other part of the building. Don't expect miracles but it is still cool. Someone in your haome could call you say 8, 10 or even 12 houses away in a subdivision or development. If the base unit has an external antenna up in a tree or on a mast above the roof then this distance can increase quite a bit, even double or 4 times. But even in wide open terrain there are practical limits, generally 1 mile per watt of power. (I am oversimplifing power here). As has been stated previously, a repeater becomes like a cell tower. If your signal can reach the repeater, it will be broadcast out in all directions from a nice high antenna and a more powerful transmitter. My repeater is a 10 watt repeater, but the antenna is at the top of a 100 foot tower on a hill 1090 feet above sea level. The average terrain is 700-800 feet above sea level so that 10 watts goes 20 miles. I have been as far as 15 miles from the repeater and used a 4 watt hand held hooked to a mobile antenna on the car and had a conversation with someone else on the repeater. This is probably not the maximum range either but a fair and reasonable observation.

For just around the house, neighborhood or out in the mall you can have alot of fun. Just remember to promte proer licensing. Too often GMRS/FRS combo owners will use the higher power GMRS channlels without a license. This is illegal but hard to police.

Well, have fun.

Subject: [GMRS] GMRS question

Hello to all,

I got my license but have to wait for the main paper to come in. I do have a call sign. I was wondering like some rules like I know you can say 10 codes, and hide stuff like lol laughs out loud, aka as known as, etc... I think the callsign has be to be reaired like 10-15 mints. I was wondering does some cities have something like if someone is out of range and they need help or talk for a few mints etc... thanks....

Topic: 12196 Message: 12426

Simply put:

Your license is official when your name and license appears in the FCC ULS (Universal Licensing System) online.

The rules for GMRS are the FCC Part 95, Subpart A Rules and Regulations, which can be viewed here:
http://www.access.gpo.gov/nara/cfr/waisidx_05/47cfr95_05.html

Rules and regulation for repeater use varies with each and every repeater system. Some owners will accept codes and other messages, pagings, and call names. Other owners will not accept this at all and will make sure that the user abides by their rules or be removed from their service.

This radio service is not a place to play on or to experiment with other equipment. Many and most users won't tolerate with misbehavior or misuse of the GMRS system, especially on their repeater systems. CB radio is one place to do that.

Any other questions you may have, feel free to ask. Glad to have you and we're especially glad that you have asked these questions first. See you on the air!

Can you cite a specific rule in Part 95 that prohibits using GMRS for business?

Here's an example to think about...

A family owns and runs a small drink stand. Can the family members (as defined in Part 95) use GMRS to coordinate their business? For example, father calling son to get more ice. Mom calling husband to make a bank run. Son taking orders and relaying them over GMRS.

Please show me where this would be prohibited in Part 95.

Or... do you mean you can't make money WITH your GMRS license, such as renting radio time, charging others for passing messages? Then I think I'm with you.

Thanks

RE: Rules concerning Permissable and Non permissable types of communication in GMRS.
Business use is NOT prohibited but there are certain rules that apply to business use. This is a long email so you might want to wait to read n get comfprtable. :-) Also included my thoughts on protecting/ maintaing the GMRS band. Just couldn't help it after all the rules being tossed around. :-)

..... A family owns and runs a small drink stand. Can the family members (as defined in Part 95) use GMRS to coordinate their business?..... YES family business is allowed.

Following are the rules of permissable and non permissable communications. Noted sections in *Bold* and my interpertations in *bold script. *
**
**

Sec. 95.179 Individuals who may be station operators.

(a) An individual GMRS system licensee may permit immediate family

members to be station operators in his or her GMRS system. Immediate

family members are the: ...*(snip... covers any family member you authorize to use your license including side relationships and in-laws)*

Sec. 95.181 *Permissible communications.*

*(a) A station operator for an individual who is licensed in the GMRS *

*(other than an employee of that individual) may communicate two-way *

*voice messages concerning the licensee's personal or business activities *
**
(If you have a family owned/ operated business, you and your family members running your business MAY conduct your family business under your individual license but NOT your employees)

*(see Sec. 95.179 above). *

(b) [Reserved

*(c) A station operator for any entity other than an individual *

*licensed in the GMRS may communicate two-way voice messages concerning *

*the licensee's business activities (see Sec. 95.179). An employee for *

*an entity other than an individual licensed in the GMRS may, as a *

station operator, communicate two-way voice messages while acting within the scope of his/her employment.

*Under a non individual, grandthered business license, persons may **communicate messages about the licensee's business activities. Employees of the licensee may communicate messages while acting within the scope of their employment, and ONLY about the licensee's business activities. The holder of a non individual license may MOT authorize anyone to use the license for anything other then the business.*

Sec. 95.183 Prohibited communications.

(a) A station operator must not communicate:

*(1) Messages for hire, whether the remuneration received is direct **or indirect; *
**
*This means If someone askes you to telephone so-n-so and/or pass on a message you may not be paid to relay the message. Just as ham operators are not allowed to receive any compensation for handeling third party traffic or relaying messages. *
*Note: if you are an operator for an answering service and the business has a GMRS license you MAY relay internal business messages, phone to radio or visa versa, to another member or employee of the business but NOT relay messages to or from clients of the answering service. *

(2) Messages in connection with any activity which is against

Federal, State, or local law;

(3) False or deceptive messages;

(4) Coded messages or messages with hidden meanings *(``10 codes'' are permissible);*
**
*(Highly recomended if you do use "10 codes" to stick to those commonly understood that refer only to weather you received a message (10-4), ask to repeat a message (10-9), signal clairity (loud & clear (10-2), poor or noisy signal (10-1) or to your in-service (10-8), out of service status (10-7). Anything other then these may not be common to all agencies. All other requests should be in plain english when providing emergency or special event communications unless instructed ohterwise by a net control operator. Some agencies may ask that certain sensitive information be "coded" and give a particilar phrase or code to use.
*
(5) Intentional interference;

(6) Music, whistling, sound effects or material to amuse or

entertain;

(7) Obscene, profane or indecent words, language or meaning;

(8) Advertisements or offers for the sale of goods or services;

*(you MAY conduct your business, communications between persons in your business, but NOT advetise your business or its services to non members of your business. As an individual you may NOT advertise the sale of anythingincluding the products or services of your family business. If you are asked
by a non member of your business about what you sell or what service you provide it is best to direct them to another means of communication to discuss it... telephone the office or tell them to SEARCH on the internet. Giving an exact web address where one could order your product or service MIGHT be considered advertising) *
*Doesn't mean you can't talk about the great bargin you got on your brand new gizmo at the local "sprawl-mart". :-) *

*BTW family business and small business use is also allowed in FRS. I am not sure if the rules have defined small business but I interpert a small business as an individual business, not a corporation or chain store business. So the local "Taco Joe's" individually owned n operated may use FRS but not the local Taco Bell which is a chain store. It may be an individual franchise but it is still under a corporation which should obtain a business license that covers each of their outlets. *

Hope this helps define business use of GMRS/FRS.
As licensees we need to educate others and self police OUR band in order to keep it as an effective means of communication and leisure time enjoyment. If you find someone using GMRS incorrectly (no license or incorrect use of a license) and only complain to others about it or attack the persons on the air then you are not helping to solve problems.

If a business is using GMRS with no license or has a license but does not identify and this bothers you as a licensed user, make a point to approach the person or manager of the busines in a *professional & friendly* manner. Take a along copy of the rules pertaining to them with sections high-lighted and explain what kinds of communications they *can* use.
Explain the benefits of obtaining a business license and use of commercial equipment vs bubble packs. Direct them to a reputable provider of radio service and where to obtain the proper license. Then let them know what can happen if a formal complaint is filed with the FCC. Give them a reasonable time frame to apply for a license. If they have been using hybrid "bubble pack" radios, advise them to stick to the FRS channels for a small business or to stick to FRS untill they obtain a proper business license for their corporate or chain store business.

Let them know you will check back with them to see how things are going in obtaining a license and offer to find them someone who can assist them if they are having any problems with the process. I have used this approach and have had success with getting unlicensed users to obtain a business license for their business or move into FRS for small business or individual communications. The few that were uncooperative got a "nasty gram" from the FCC following a formal complaint and then decided to get a license. If you don't feel comfortable making a person visit then send a friendly & professional letter along with a set of rules high-lighted etc, etc, etc.

Expecting the FCC to do all the work is like driving your car without doing any maintnance and expecting it to not break down. Just as flat tires don't get fixed by themselves, and the oil doesn't magically get renewed. We have to do something to help maintain GMRS. Just as you have to get your car to the mechanic for service you have to get enough information into the hands of the FCC if you expect them to do anything about a particular problem.

Along with education goes edfication. When a business cooperates and moves their communications into the proper band be sure to congradulate them, promote them, and send send them some customers. Be a welcome guest instead of an annoying pest and you just might create new friends and business network contacts.

Thats my "two cents" What's yours? :-)

Anyone still reading at this point have a success story to share or another rule to discuss??? :-)

Mary

Hello Ray Vaughn 99,

You are totally correct. I was indicating that you cannot communicate for a fee. Using the radios in a business as you described IS permitted in the scenario you have created. And only one license is needed because everyone is in the same family. Notice I said "You may use GMRS for . . . personal business" and when I said never as a profit making adventure I said later not communicating for a fee, as you have said, charging a fee to pass traffic, etc. So we are in agreement.

One thing you can do (and this is just my opinion) is don't use one of those automatic Morse-code ID'ers or those synthesized voice devices that hams (and some GMRS'ers) use on their repeaters.
"Double-U-Four-Six-REE-PEE-TER"

Hate 'em! And they serve no purpose that I can see. Coming up after a conversation is fine, but some of those things go off every 15 minutes. I consider them as annoying as kids using bubble pack radios screaming "can you hear me!!!!?"

Thanks.... and welcome!

Hi Swannie:

If you've paid your fee and applied over the web, then you're in!

Now don't let these guys scare you off. For many of us, GMRS is NOT a stepping stone or "cousin" or "relative" of ham radio. We're in GMRS because we want to communicate, but without the restrictions. For me and my friends GMRS is a tool, it isn't the hobby. GMRS is also a fine tool for emergency communication, but it is by no means dominated by that use.
Many of us use our radios for hobbies (I chase trains with friends), recreation and just having fun. Use the basic rules of good judgement; ID yourself, don't cause trouble for others on the channel, keep your conversation civil and you're fine. You should feel free to
do whatever you wish with your GMRS radio.

Good Luck!

Danny Harmon

">>...but never as a profit making venture..."

My understanding of the above rule is that you cannot charge a fee to transmit messages via GMRS, no? That is what I meant, I may have been a little too ambiguous. I did not mean that a profit-making concern could not use GMRS (ie the family business described in other response or a grandfathered business licensee). Sorry.

95.33(3) A station may be shared only: (i) Without charge; (ii) On a non-profit basis, with contributions to capital and operating expenses including the cost of mobile stations and paging receivers prorated equitably among all participants; or (iii) On a reciprocal basis, i.e., use of one licensee's stations for the use of another licensee's stations without charge for either capital or operating expenses...

95.101(b) The license does not authorize operation as a common carrier or communication of messages for pay...

95.183(a)(1) Prohibited communications: Messages for hire, whether the remuneration received is direct or indirect...

I think it is very clear whether or not you can or can't make a profit off of GMRS. It's okay to review the rules every once in a while to back up your statement, but it shouldn't be practiced to claim one thing and not state a rule after it.

This is the easiest way to clear up a matter. The FCC rules stated a fact and true point, and thus ended this conflict without proving myself right or wrong. This is why I always review the rules online before replying to a post that argues a valid (or invalid) rule or point in GMRS. I don't want to be caught wrong in my statement.

It's a good practice, and it helps you to memorize the rules at the same time.

Good one Mary,

Nice redux of the rules although the italics did not make it through.

So my local Cracker Barrel restaurant has outfitted all the staff with FRS radios and ear buds. Opps! I can listen in if I get close enough LOL. Also my local KFC/Taco Bell uses a MURS channel for the drive thru headset. I suppose if I called in an order it would be causing illegal interference.

Sec. 95.179 Individuals who may be station operators.

(a) An individual GMRS system licensee may permit immediate family

members to be station operators in his or her GMRS system. Immediate

family members are the: ...*(snip... covers any family member you authorize
to use your license including side relationships and in-laws)*

Sec. 95.181 *Permissible communications.*

*(a) A station operator for an individual who is licensed in the GMRS *

*(other than an employee of that individual) may communicate two-way *

*voice messages concerning the licensee's personal or business activities *
**
(If you have a family owned/ operated business, you and your family members running your business MAY conduct your family business under your individual license but NOT your employees)

*(see Sec. 95.179 above). *

(b) [Reserved

*(c) A station operator for any entity other than an individual *

*licensed in the GMRS may communicate two-way voice messages concerning *

*the licensee's business activities (see Sec. 95.179). An employee for *

*an entity other than an individual licensed in the GMRS may, as a *

station operator, communicate two-way voice messages while acting within the scope of his/her employment.

*Under a non individual, grandthered business license, persons may
**communicate messages about the licensee's business activities. Employees of the licensee may communicate messages while acting within the scope of their employment, and ONLY about the licensee's business activities. The holder of a non individual license may MOT authorize anyone to use the license for anything other then the business.*

Sec. 95.183 Prohibited communications.

(a) A station operator must not communicate:

*(1) Messages for hire, whether the remuneration received is direct **or indirect; *
**
*This means If someone askes you to telephone so-n-so and/or pass on a message you may not be paid to relay the message. Just as ham operators are not allowed to receive any compensation for handeling third party traffic or relaying messages. *
*Note: if you are an operator for an answering service and the business has a GMRS license you MAY relay internal business messages, phone to radio or visa versa, to another member or employee of the business but NOT relay messages to or from clients of the answering service. *

(2) Messages in connection with any activity which is against

Federal, State, or local law;

(3) False or deceptive messages;

(4) Coded messages or messages with hidden meanings *(``10 codes'' are permissible);*
**
*(Highly recomended if you do use "10 codes" to stick to those commonly understood that refer only to weather you received a message

(10-4), ask to repeat a message (10-9), signal clairity (loud & clear
(10-2), poor or noisy signal (10-1) or to your in-service (10-8), out of
service status (10-7). Anything other then these may not be common to all
agencies. All other requests should be in plain english when providing
emergency or special event communications unless instructed ohterwise by
a net control operator. Some agencies may ask that certain sensitive
information be "coded" and give a particilar phrase or code to use.
*
(5) Intentional interference;

(6) Music, whistling, sound effects or material to amuse or

entertain;

(7) Obscene, profane or indecent words, language or meaning;

(8) Advertisements or offers for the sale of goods or services;

*(you MAY conduct your business, communications between persons in your
business, but NOT advetise your business or its services to non members of
your business. As an individual you may NOT advertise the sale of
anythingincluding the products or services of your family business. If
you are asked
by a non member of your business about what you sell or what service you
provide it is best to direct them to another means of communication to
discuss it... telephone the office or tell them to SEARCH on the internet.
Giving an exact web address where one could order your product or service
MIGHT be considered advertising) *
*Doesn't mean you can't talk about the great bargin you got on your brand
new gizmo at the local "sprawl-mart". :-) *

*BTW family business and small business use is also allowed in FRS. I am not
sure if the rules have defined small business but I interpert a small
business as an individual business, not a corporation or chain store
business. So the local "Taco Joe's" individually owned n operated may use
FRS but not the local Taco Bell which is a chain store. It may be an
individual franchise but it is still under a corporation which should obtain
a business license that covers each of their outlets. *

Hope this helps define business use of GMRS/FRS.
As licensees we need to educate others and self police OUR band in order to
keep it as an effective means of communication and leisure time enjoyment.
If you find someone using GMRS incorrectly (no license or incorrect use of a
license) and only complain to others about it or attack the persons on the
air then you are not helping to solve problems.

If a business is using GMRS with no license or has a license but does not
identify and this bothers you as a licensed user, make a point to approach
the person or manager of the busines in a *professional & friendly* manner.
Take a along copy of the rules pertaining to them with sections high-lighted
and explain what kinds of communications they *can* use.
Explain the benefits of obtaining a business license and use of commercial

equipment vs bubble packs. Direct them to a reputable provider of radio service and where to obtain the proper license. Then let them know what can happen if a formal complaint is filed with the FCC. Give them a reasonable time frame to apply for a license. If they have been using hybrid "bubble pack" radios, advise them to stick to the FRS channels for a small business or to stick to FRS untill they obtain a proper business license for their corporate or chain store business.

Let them know you will check back with them to see how things are going in obtaining a license and offer to find them someone who can assist them if they are having any problems with the process. I have used this approach and have had success with getting unlicensed users to obtain a business license for their business or move into FRS for small business or individual communications. The few that were uncooperative got a "nasty gram" from the FCC following a formal complaint and then decided to get a license. If you don't feel comfortable making a person visit then send a friendly & professional letter along with a set of rules high-lighted etc, etc, etc.

Expecting the FCC to do all the work is like driving your car without doing any maintnance and expecting it to not break down. Just as flat tires don't get fixed by themselves, and the oil doesn't magically get renewed. We have to do something to help maintain GMRS. Just as you have to get your car to the mechanic for service you have to get enough information into the hands of the FCC if you expect them to do anything about a particular problem.

Along with education goes edfication. When a business cooperates and moves their communications into the proper band be sure to congradulate them, promote them, and send send them some customers. Be a welcome guest instead of an annoying pest and you just might create new friends and business network contacts.

Thats my "two cents" What's yours? :-)

Anyone still reading at this point have a success story to share or another rule to discuss??? :-)

Very good poin, Ryon.
Lets not forget where this started.

Original message from Swannie:

> Hello to all,
>
> I got my license but have to wait for the main paper to come in. I do
> have a call sign. I was wondering like some rules like I know you can
> say 10 codes, and hide stuff like lol laughs out loud, aka as known
> as, etc... I think the callsign has be to be reaired like 10-15 mints.
> I was wondering does some cities have something like if someone is out
> of range and they need help or talk for a few mints etc... thanks....
>
>

In all our banter, have your questions been answered?
If not feel free to ask again or ask other questions.
If we haven't scared you off let us know your state and general
location and someone here can direct you to a group of users in your area
or to one or more repeater owners who can asist you in extending your
communications range.

By George! I think were all on the same page!. :-)
Now if we can just get Swannie to come back and join in. :-)
How about it Swannie?
or perhaps go to SoCalGMRS.org
tonight at 8 PM PDT and join in a live chat with the users on the Verdugo
repeater here in So Cal. Just click on chat and type in the user name you
wish to use.
No pasword needed.

We have a roll call at the same time on the repeater for all our authorized
users to
meet n greet. The machine is set up for social use but those of us involved
in
various clubs or volunteer public safety organizations promote such on the
net.
If you are within range of the Verdugo Repeater (LA, Orange, West Riverside,

and some parts of North San Diego Counties) and want to join as an
authorized
user just email the owner through the SoCalGMRS.org website with your
license
info and you will be sent the access info. FREE to join, no fees.
If you can hear the net but not in range to get into it have your pen,
pencil,... crayon
ready to take down phone numbers to call in and say "Hi"
We have gotten some of the "bubble pack" users to get their license and
get real radios. Just so they could join the fun. :-)

* Not quite sure what you mean, but repeater systems (50 watts max) are
allowed on GMRS. You can find one in your area by asking, or you can build your
own.

Have fun with your radios, but as long as you follow the basic and simple
rules and guidelines, you should be fine. Just remember, it's not like a
cellphone. Everyone can hear everything you say, no matter how many sub-tones (PL,
CTCSS, DCSS) you use on your radio.

Here's the direct link to the FCC Part 95 website, where you can find every
current rule regarding GMRS:
http://www.access.gpo.gov/nara/cfr/waisidx_05/47cfr95_05.html

Welcome to the world of Radio Communications! We're glad you came and we're
happy to help in any way that we can!

I believe that we are all in agreement that you cannot make GMRS transmissions for hire. And Ryan also reminds us that a repeater cannot be turned into a profit making club, etc. So we can probably rest this case. As I stated in my last response, I believe I left some ambiguity in my orginal comment and someone took it the wrong way. However, he and I have now agreed on the meaning. Thanks for the clarity here Ryan.

95.33(3) A station may be shared only: (i) Without charge; (ii) On a non-profit basis, with contributions to capital and operating expenses including the cost of mobile stations and paging receivers prorated equitably among all participants; or (iii) On a reciprocal basis, i.e., use of one licensee's stations for the use of another licensee's stations without charge for either capital or operating expenses...

95.101(b) The license does not authorize operation as a common carrier or communication of messages for pay...

95.183(a)(1) Prohibited communications: Messages for hire, whether the remuneration received is direct or indirect...

I think it is very clear whether or not you can or can't make a profit off of GMRS. It's okay to review the rules every once in a while to back up your statement, but it shouldn't be practiced to claim one thing and not state a rule after it.

This is the easiest way to clear up a matter. The FCC rules stated a fact and true point, and thus ended this conflict without proving myself right or wrong. This is why I always review the rules online before replying to a post that argues a valid (or invalid) rule or point in GMRS. I don't want to be caught wrong in my statement.

It's a good practice, and it helps you to memorize the rules at the same time.

Hello to all,

I read you all messages. I went and try to see if my town has any repeaters none so far. I found this site

http://www.g-m-r-s.org/repeaters4gmrs.htm#FL

I hear a few people on FRS or GMRS when they drive by or walking in town etc.... I have a HT1250 UHF I have the channels programed in for FRS/GMRS. If I had extra radios I won't sell the time or anything like that. If my buddy go to a ballgame we usual talk on FRS. Now I can talk on any channel but he will be on my other gmrs/frs radio. I know some people will or will not allow to use the repeater unless you ask or for a emergency stuff. Thanks for all the replys. I wasn't to sure about the call sign time like 10-15 I figure 10 like the ham lol.

12441. GMRS Repeater Locations and Frequencies

Yahoo group: GMRS (2005 — 2007)

From: Joe
Topic: 12441 Message: 12441

Hello Everyone, from WQGH806/KA1GDQ

I just got back into GMRS and I have noticed the LACK of open or semi private repeaters in Massachusetts.

There are a couple on the South Shore (Quincy/Bridgewater/Westwood) that are not related to the MassNet (FIRE BUFF Network). There is only 1 on the Cape that is also part of the MassNet, which I do belong to.

Are there any other users on the Cape besides myself. Any other repeaters on the South Shore and the Cape?

I am trying to make a MASSACHUSETTS Repeater listing on my website (http://ka1gdq.tripod.com/ham.htm), of at least the frequencies and contact names on who to contact for permission.

I noticed in other databases that CA has a bunch and there are quite a few in FL.

Does anyone have any more input on MA repeaters or users??

Joe Reynolds

...You may use GMRS for your own personal use including leisure time,
persoanl business, etc but never as a profit making venture...

CLINT>>...Nope - that is not correct.

>...This is why I always review the rules online before replying to a post that
> argues a valid (or invalid) rule or point in GMRS. I don't want to be caught
> wrong in my statement.

The original statement is incorrect. One should *never* use absolutes (grin). Businesses by definition transact money. And businesses may legally use the GMRS. And REACT teams, who accept donations for their work.

I'll leave the semantics to others here with more experience in the GMRS. I've only been intimately involved since the early 1990s.

Clint Bradford, KAF3359

12443. Maxon 210+3 and Uniden GMR100 Manuals

Date: 2007-03-23 12:04:15 UTC
From: Matthew
Topic: 12443 Message: 12443

Hi Group,

Would anyone in the group happen to have a copy of the Maxon 210+3 and Uniden GMR100 user/owner manuals they would be willing to e-mail to me at MatthewRP@... ? I bought the radios together used but unfortunately the lady I bought them from had no manuals to go with the radios. I have been searching for each manual for a few months now with no luck so far. Also, while reading through some of the older post I saw that there was mention of an adaptor that can be used in conjunction with the 210+3 so as to attach an external antenna. Would anyone know where I could find such and adaptor?

Thanks,
Matthew

Subject: [GMRS] Maxon 210+3 and Uniden GMR100 Manuals

Hi Group,

Would anyone in the group happen to have a copy of the Maxon 210+3 and Uniden GMR100 user/owner manuals they would be willing to e-mail to me at MatthewRP@... ? I bought the radios together used but unfortunately the lady I bought them from had no manuals to go with the radios. I have been searching for each manual for a few months now with no luck so far. Also, while reading through some of the older post I saw that there was mention of an adaptor that can be used in conjunction with the 210+3 so as to attach an external antenna. Would anyone know where I could find such and adaptor?

Thanks,
Matthew

Hi Matt,

I can help you as for the GMRS 210+3 Programming Manual. Would you like it mailed or emailed?

Did you mean GMR-1 or GMR-100? I also own two GMR100 radios.

Ed

First, let me thank everyone who made great suggestions. I have tried them all. And yes, I have tried the external microphone, with the same results, the radio stays in transmit.

I will contact R K Leef as a last ditch effort. Unfortunately, Pryme tells me that they no longer provide support for this radio and parts are not available. I suspect that the radio "controller" has become defective. The strange thing is that it's happened to two radios!

Ron

Hi Ron,

You can send your radios to Bob (rkleef.com), and he can reset and reprogram them for you. That's my only last guess and probably his.

Good luck. Do let us know what happens (keep us up to date on the progress).

12450. Re: Pryme PR-460 Repair

Yahoo group: GMRS (2005 — 2007)
Date: 2007-03-26 20:22:49 UTC
From: August
Topic: 12413 Message: 12450

Ron,
A bit more detail would be very helpful since both hand held's have the same problem. Two thoughts come to mind. The first is your battery condition. And the second one that first came to mind is a stuck (binding) PTT switch.

Is there any chance the PTT switch is sticking? How do you recover from this situation? If it sticks in TX do you then turn it off and when turned right back on it is back in receive mode?

Are you using the Speaker Mic or Headset Mic with these units or as just a basic hand held unit? If so, do you have a handset to try with these units to see if the problem still exists using an external PTT button.

With some units due to their design when the battery voltage gets low they may stay in TX until the battery goes completely dead. When you go to TX mode the current draw on the battery is far greater than in receive mode. If a weak or defective battery is the problem this will cause the battery voltage to drop quickly and stick the unit into TX mode due to loss of control at the chip level. A small chance of this but it can happen.

Also if you are using a speaker mic or headset this can allow RF to enter the control circuits and also keep it in TX mode. If so just try it without the speaker mic.

Some more data would be helpful so we can be helpful!! (:-)

boy, i am so lucky <knock knock>. I have two of these
with keypad, 2 w/o keypad, 1 in VHF, and 1 programmer.
both the PR-460s w/keypad seem to be working in tip
top shape, though i was a bit apprehensive when the
Nimh units started to die. but I see that one of the
battery outfits still support this radio and should
have some in next month.

if anyone needs, I'm ready to sell the UHF ones w/o
keypad on Ebay, as well as the VHF one.

i also have a no-name (prob Taiwan) keypad programmable
UHF...NIB that I dont need as it wasn't compatible with
the
system i have at work.

hope you find a fix for that sticky MIC button. you're
not
the first to report this ailment. seems to be a weak spot
for this radio.

Narrowband like a standard business or public
service(police, fire, etc.)radio. Wideband is for FM
broadcast stations.

The frequencies authorized are only 12.5KHZ apart (the GMRS 'channels' and the repeater inputs on 462) - so I would have to assume that 12.5khz spacing - typically called narrow band - would be needed so as to not interfere with adjacent freqs.

The FRS service (and 'bubble pack' GMRS radios) do, I believe, also operate on this 12.5khz 'narrow band' spacing. There are 2 specs in GMRS for deviation based on ppm (.05% and .025%). However those specs are imbedded in the regs with other currently non-existent items like 'small base stations').

Sooo.. Do we need a communications specialty attorney to make this call ?

12458. Cable to connect computer to CT150 (motorola HT)

Yahoo group: GMRS (2005 — 2007)
Date: 2007-03-27 15:34:25 UTC
From: hazmatt1981
Topic: 12458 Message: 12458

Hi,
I'm looking for how to make a cable for a Motorola CT150 HT.
Basically, I want to hook the HT up to my computer and run EchoTime
(an amateur radio program) to ID my repeater (I do not plan to use any
echolink features, or connect the repeater in any way to any Amateur
bands) and record repeater usage.

Does anyone know what the pin out would be for:

Mic/PTT and Speaker?

GMRS is wide band. FRS is narrowband.

Standard business can be either.

FM Broadcast is a whole nother animal.

Hi Joe,

You're correct; there aren't many repeaters in this state. I have an old GMRS repeater directory which shows these repeaters on the Cape.

462.600 Barnstable
462.650 Marstons Mills

The information is 10 years old, so they may no longer exist. I live in the Worcester area and although there are repeaters listed, I never hear anyone on these frequencies.

Maybe someone else has more recent information.

August,

These radio's go into transmit as soon as you turn them on. If you cycle power again, they then go into receive. If you push the PTT button, they transmit and stay there until you cycle to power. In receive the radios work normally.

At the suggestion of Ryan, I took one of the radios apart and cleaned the PTT button. It didn't help. That would stand to reason because the remote speaker/mic does the same thing on both units.

You bring up a good point about the batteries. This all seemed to happen after both radios had not been used for about a year. As well, the original batteries really didn't want to take a charge. I bought two new replacements (talk about throwing good money after bad!) but these didn't help either. At this point I'm inclined to believe that due to the batteries going dead in both radios where they exhibit the same symptoms, it's possible that the programming has been corrupted.

Thanks to everyone on this board.

Ron

Topic: 12413 Message: 12464

I almost sent an e-mail about this same question the other day.

Is there any movement similar to the industrial/business & public safety pools to narrowband the GMRS frequencies? It would theoretically add about 26 Frequencies to the GMRS/FRS band between 462.550-462.725 & 467.550-467.725.

However, the natural progression on the other systems has been the "Splinter" frequencies (6125, 6375, etc) become regular or High-Power. Currently, there's power restrictions all around and especially w/FRS. I suppose the logical movement would be Low-Power (aka FRS) would be moved to the newer frequencies (i.e. 462.55625). But FRS is pretty much entrenched with thousands and thousands of radios already out there.

Curious if the Steering Groups and others have begun seeing if it's even desirable and if so how.

If I'm reading 95.633 correctly:
Regular GMRS frequencies are spaced 25KHz apart with
an allowable bandwidth of 20KHz for F3E (FM)
modulation. Interstitial frequencies, which are shared
with FRS, are at 12.5KHz channel spacing with a 5KHz
bandwidth(?).

Now, I understand my interpretation may be flawed but
when I use my bubblepacks, that's what I'm allowed due
to radio design.

12468. GMRS - question for Blake

Yahoo group: GMRS (2005 — 2007)
Date: 2007-03-27 23:38:41 UTC
From: Duane Vincent
Topic: 12413 Message: 12468

Blake, I understand that radios type certificated
under Part 90 prior to a certain date are also
permissible under Part 95 GMRS. What was that date?

Duane

We won't tell. Get more on shows you hate to love

From: kevin asato
Topic: 12413 Message: 12469

If I'm reading 95.633 correctly:
Regular GMRS frequencies are spaced 25KHz apart with
an allowable bandwidth of 20KHz for F3E (FM)
modulation. Interstitial frequencies, which are shared
with FRS, are at 12.5KHz channel spacing with a 5KHz
bandwidth(?).

Now, I understand my interpretation may be flawed but
when I use my bubblepacks, that's what I'm allowed due
to radio design.

12472. Re: [GMRS] GMRS - wideband or narrowband?

Yahoo group: GMRS (2005 — 2007)
Date: 2007-03-28 01:17:24 UTC
From: kvsp1160@aol.com
Topic: 12413 Message: 12472

After reading the posts that were given already, I had to chime in. =c)

Part 95.627: FRS frequencies are 25 KHz apart (wide band): 462.5625, 462.5875, 462.6125, etc.

Part 95.621: GMRS frequencies are 12.5 KHz apart (narrow band) only in the 462 frequency range: 462.6500, 462.6625, 462.6750, etc.

Our standard GMRS frequencies that we use (462.5750, 462.6000, 462.6250, etc) are 25 KHz apart (wide band).

So the question is, is GMRS wide band or narrow band?

It depends if you are referring to the 16 frequencies (462/467) that we normally operate on, or the 16 original frequencies that originate on the 462, plus the additional 8 frequencies on the 467.

My answer would be wide band. GMRS consists of the following 16 frequencies:
462.550, 462.575, 462.600, 462.625, 462.650, 462.675, 462.700, 462.725 MHz.
467.550, 467.575, 467.600, 467.625, 467.650, 467.675, 467.700, 467.725 MHz.

This information was referenced from FCC Parts 95.621 & 95.627, found here:
http://www.access.gpo.gov/nara/cfr/waisidx_05/47cfr95_05.html

Neither of the below, but thanks for the suggestion. What I am looking for would be the pin-out for how to make this radio keyup using a serial port. I know how to connect the audio, the question is how to make it keyup.

> My answer would be wide band. GMRS consists of the following 16 frequencies:

No - the GMRS consists of eight repeater pairs, plus seven interstitials. That equals 23 frequencies.

462.5500, 462.5750, 462.6000, 462.6250, 462.6500, 462.6750, 462.7000 and 462.7250.

In duplex mode: 467.5500, 467.5750, 467.6000, 467.6250, 467.6500, 467.6750, 467.7000 and 467.7250.

And in simplex mode, 462.5625, 462.5875, 462.6125, 462,6375, 462.6625, 462.6875 and 462.7125.

Clint Bradford, KAF3359

From: Duane Vincent
Topic: 12413 Message: 12479

Clint writes: "No - the GMRS consists of eight repeater pairs, plus seven interstitials. That equals 23 frequencies. 462.5500, 462.5750, 462.6000, 462.6250, 462.6500, 462.6750, 462.7000 and 462.7250.

In duplex mode: 467.5500, 467.5750, 467.6000, 467.6250, 467.6500, 467.6750, 467.7000 and 467.7250. And in simplex mode, 462.5625, 462.5875, 462.6125, 462,6375, 462.6625, 462.6875 and 462.7125."

The way that I read it is that the 467 freq may only be used as inputs to a repeater, but the 462 freqs may be all used as simplex.

Yahoo group: GMRS (2005 — 2007)
Date: 2007-03-29 02:00:42 UTC
From: Paul M Schmitter
Topic: 12413 Message: 12491

There is a difference between wideband/narrowband and
wide and narrow channel spacing.

Channel spacing is the width between channels while
wide band/ narrow band is the bandwidth that a signal
occupies.

It's a matter of terminology. Narrow band always used
to mean business band communications because of the
bandwidth the signal took up compared to FM broadcast,
which was considered wide band.

Is it just me, or are we all getting repeat posts in this group?

It's getting very annoying...

So Far, I've received over 8 emails from the same person posting the same comment.

Anyone else have this problem?

You are absolutely correct. Narrow band **USED**
to mean LMR type communications, and wide band **USED**
to mean broadcast.

Times have changed however, and narrow band means
2.5Khz deviation as opposed to 5khz deviation.

Many things have different meanings than they did 50 years
ago.

Thanks for agreeing with me.

12496. Yahoo bug fix

Yahoo group: GMRS (2005 — 2007)
Date: 2007-03-29 21:22:19 UTC
From: Walters
Topic: 12496 Message: 12496

From Stan WQFD736

Got this on the developers blog.

Duplicate Messages and Email Delivery
Update (8:00 am PST, 3/29): A fix was pushed at midnight (Pacific Time) that we believe has resolved the problem for messages submitted after that time. However, it is possible that some users of some groups may have continued to receive duplicates of messages that were posted before midnight.

We're aware of the duplicate message bug that began affecting groups today (Wednesday, March 28th) and are working to resolve the issue (a side effect of this bug is that some messages are also being delayed). We have actually pushed two fixes already, but we are aware that some groups are still experiencing the problem and that more needs to be done to fully resolve the issue.

There is, however, one silver lining to this bug. It was the result of our latest system updates intended to improve email delivery speeds. So once the bugs are resolved, we should see a significant reduction in the time it takes to deli ver messages to Yahoo! Groups members.

We will update this blog entry as soon as we have more definitive information on the status of this issue.

Thank you and our apologies for any inconvenience caused by the duplicate messages.

The Yahoo! Groups Team

P.S. It would be helpful to get reports of duplicate issues if your groups are still experiencing the problem with messages submitted (not received) after 8:00 pm PST. If so, please add a comment to the bug letting us know the name of your group and the message numbers of the duplicate messages. Thanks!

No virus found in this incoming message.
Checked by AVG Free Edition.

Yahoo is having some "issues" after making some changes to their system.
Many of the groups that I am subscribed to has sent multiple (8 to 9)
copies of every message posted to the group.

Fortunately, group activity has been down, otherwise this would have been
a nightmare.

It appears that they have corrected the problem - time will tell though.

12500. Business Use of GMRS

Yahoo group: GMRS (2005 — 2007)
Date: 2007-03-30 17:32:09 UTC
From: hazmatt1981
Topic: 12500 Message: 12500

Hi,
Just wanted to run something by everyone here. I know you can use GMRS for "family business". My question is. If there are two of us at a place of employement, and we are not of the same family, but we both are licensed GMRS users, can we use a GMRS repeater to discuss business? (The repeater owner has okayed it).

I see nothing in the rules of Part 95 prohibiting this type of behaviour.

12501. Re: Cable to connect computer to CT150 (motorola HT)

Yahoo group: GMRS (2005 — 2007)

From: hazmatt1981
Topic: 12458 Message: 12501

Right, but don't I have to have a DingoTel account? Plus, I don't
think it will work with EchoTime. I'm basically trying to have EchoTime:

ID the repeater, beacon on the hour, and alert for severe weather.

So, unless echolink/echotime will work with the dingo-tell device,
that doesn't help.... to me it seems like DingoTel only works with
DingoTel service.

Subject: [GMRS] Business Use of GMRS

Hi,
Just wanted to run something by everyone here. I know you can use
GMRS for "family business". My question is. If there are two of us
at a place of employement, and we are not of the same family, but we
both are licensed GMRS users, can we use a GMRS repeater to discuss
business? (The repeater owner has okayed it).

I see nothing in the rules of Part 95 prohibiting this type of behaviour.

From: hazmatt1981
Topic: 12503 Message: 12503

Hi,
From my understanding of the FCC rules regarding GMRS, an autopatch is a negative.

My question is, is it illegal to connect to something that will let you talk with an unlicensed individual, if a licensed person needs to initiate the connection?

That is, autopatch is illegal, but if I have to enter #1234, to make the repeater connect me to an internal networked communication device that someone who is unlicensed uses, is that legal, or not?

From: Dan Fink
Topic: 12507 Message: 12507

Hi all. I need some advice on setting up a community safety/ community chat system. I'm a licensed ham operator and also licensed on the public safety bands, I'm an officer in a fire dept. We are in a remote, off-grid community in Colorado that has no phone lines or cell service.

Us hams up here are really into radio, and at least a couple of us will buy GMRS licenses right away before we get this all set up. But others in the area can't afford the license fee; fixed incomes and such. And they are not willing to study for the ham test.

We'd like to set up a system where the licensed users can have some nice base station radios, possibly a repeater, but still talk to (and receive emergency and non-emergency calls from) the non-licensed users that can only afford the legal FRS radios from K-mart. I realize the FRS users could not use the repeater, that's OK.

- is this legal? (GMRS to FRS communications and vice versa, with GMRS folks licensed and FRS folks not)
- what's the best bang for the buck on a base/vehicle GMRS radio? We'd make our own antennas, us crazy hams are into that. 5 watts should cover the entire canyon.
- the goal being, for example -- I already monitor several ham channels 24/7 and would like to monitor FRS plus GMRS 24/7 in case of emergency. Then I can relay info (NOT patch it through on the radio) directly to the sherriff's dept.

It's somewhat scary up here for non-ham and non-fire dept folks -- they have to physically DRIVE to my house, at least a mile, and have me call the sheriff or ambulance. And of course even find out if it's OK to come over for coffee! A combined FRS - GMRS system sounds ideal for us.

Any thoughts or recommendations?

Thanks in advance!

"internal networked communications device" - PBX, VoIP? still smells like an autopatch to me. The law forbids connnection to wireline facilities but has not been updated to take into account the various alternate means of connectivity. However, devices as DingoTel, a VoIP devices, have been given the thumbs down for use on GMRS. (I read it in the archives somewheres but cannot remember the message group. There are also messages regarding linked transmitters.)

The intent of GMRS is to be a local communications system. No linked repeaters, no autopatch. If you need the ability to communicate over distances using telecommunications and/or internet facilities between licensed and unlicensed communicators, consider amateur radio.

It is possible to communicate with an unlicensed operator using the FRS frequencies using your GMRS radios. As a licensed operator, give your call sign at the proper intervals and you will be legal.

12509. INTERSTATE 95 CORRIDOR GMRS TRAVEL/OPEN GMRS RPTS

Yahoo group: GMRS (2005 — 2007)
Date: 2007-04-02 02:28:16 UTC
From: Joe
Topic: 12509 Message: 12509

Ok, I know the Subject was long, but let me explain.

I want to create an INTERSTATE GMRS Mapping database.
What we need to do is to list ALL of the OPEN & REACT GMRS repeaters along the I-95 Corridor from Maine to Miami. I also went to add other Interstates as well. We create a database, get a mapping program, add the repeaters to the Maps and post them on this group, in the FILES section.

Anyone like or dislike the idea? I have all the GMRS/141.3 repeaters listed in my new Vertex, but if there are others with locations that users want to add, (pls include tones) we could create a nice database.

The other Idea was, for those not using PL 141.3, try and match the tone to the Interstate if possible (I know we can get it exact in all situations, but we can get damn close..).

Does any one like or dislike the idea?

No matter how you do it, connection of a GMRS unit to landline/wireline/internet for ANY purpose other than control functions of the system is prohibited. Interlinking audio is not allowed. As far as I can tell, connection to other radio frequencies internally would also be prohibited, unless they're other GMRS frequencies.

The question of being allowed to talk to unlicensed (FRS) people is seperate. Way I read it, they're 'authorized' to be on the air, and thus 'licensed' under the meaning of the rules. As long as they're operating legally, that is. An illegal Bubblepack user using GMRS frequencys/power levels isn't authorized, and is therefore unlicensed and a no-no to talk to.

Here is where I get cynical. When one is beginning to talk to an obviously unlicensed user, how do we know what power setting they are on? Do we ask; "What power setting are you using?". Hell, most of these folks don't even know, or care, what channel they are on, let alone if they are on "high" or "low". In fact most bubblepack radios are set for high on everything except the 467.xxxx freqs. And of course high is better, right?

My philosophy is that anyone on the interstitial freqs I typically ignore, other than the occasional suggesting to "STOP CONSTANTLY HITTING THAT CALL TONE!"
I basically use those ch's for local family comms so I do keep them in my radios. I don't like to use the repeater input freqs for this so as not to interfere with anyone.
Ch's 1-3 are a total joke around here.

If they can't afford the GMRS License fee, they can't afford the
base/mobile radios, either, which run much more expensive
than 'bubble packs', $180+ for a simple HT, $250-$400 for a mobile.

There aren't many real FRS radios being offered, these days. Most of
what you'll be able to get are 'GMRS/FRS' radios, which are, um, the
cause of some problems with piracy. Ah, well.

Anyway, the combined units have FRS channels 1-14 in them, BUT, most
of them operate at GMRS power levels on channels 1-7, and so are not
legal to use on those channels without a GMRS license. They're
only 'legal' for FRS use on channels 8-14. So, you should probably
plan on putting your system on one of those channels... except that,
oh, darn, those are the FRS channels that GMRS users are NOT allowed
to use. If you can find radios which have legal .5 watt power on
channels 1-7, you can interoperate FRS and GMRS on those. Channels
15-22 are GMRS only on the bubble pack radios.

Oh, be aware that the channel numbering on 'real' GMRS radios may be different from the bubble pack channel plans. Usually a GMRS radio has channels 1-8 as the repeater pairs, which are channels 15-22 on bubble packs, while channels 9-15 on GMRS are channels 1-7 on bubble packs. Confusing, isn't it?

> - is this legal? (GMRS to FRS communications and vice versa, with
> GMRS folks licensed and FRS folks not)

As best I can tell, a GMRS user operating on an FRS frequency (note that there are some FRS channels where GMRS users are not allowed) can talk to the FRS users, as long as those FRS users are themselves legal. If the 'FRS' people are using illegal high power bubble pack GMRS gear, they'd be illegal to talk to, way I read the rules.

> Any thoughts or recommendations?
> DAN
> kc0vrd (ham)
> larimer rc323 (fire)
> GMRS pending
>

To complete the info hopefully, FRS and GMRS channels:

CHANNEL FREQUENCY for FRS
01 462.5625
02 462.5875
03 462.6125
04 462.6375
05 462.6625
06 462.6875
07 462.7125
08 467.5625
09 467.5875
10 467.6125
11 467.6375
12 467.6625
13 467.6875
14 467.7125

GMRS Repeater Channels - CHECK radio manual, may not be in this order!
CH Output Input
1 462.550 467.550
2 462.575 467.575
3 462.600 467.600
4 462.625 467.625
5 462.650 467.650
6 462.675 467.675
7 462.700 467.700
8 462.725 467.725

GMRS Interstitial Channels, shared with FRS
9 462.5625
10 462.5875
11 462.6125
12 462.6375
13 462.6625
14 462.6875
15 462.7125

I believe there's an attempt to get FRS channel 1 considered to be the 'emergency' channel for calling for aid, and such, probably you could use that as your calling channel.

The law says no interconnect to the PSTN. Not
no connection to wireline facilities.

Also, where has the FCC stated (in writing of course)
that a connection such as Dingotel is not allowed?

That was generally my reading of the law, but I was curious what others thought. I do have an amateur license, so I use that for linking and autopatch :) And the GMRS repeater works nicely for around town to talk to the family.

Under prohibited communications for a GMRS station, you find:
---
(12) Messages which are both conveyed by a wireline control link and transmitted by a GMRS station;

That would cover direct audio wired remote, dedicated landline, or any other non-radio method of linking audio.

Since the rules also specify that repeaters must use the designated 467 MHz inputs, no secondary input frequencies, either.

Wireline is out, so you'd have to interlink by radio. What service? GMRS isn't allowed to talk to other services except those also licensed on GMRS frequencies. Currently, that'd only be FRS users on some of their channels that are shared.

Control links cannot convey audio to GMRS station, only 'control' of the station's status as on/off, pretty much.

Much of this stuff hasn't been directly stated firmly, yet, as it seems not to have come up too often. However, you need to bear in mind what the FCC thinks the GMRS service is. It's intended as a personal, family service, not for businesses, not for particularly long range or wide area. It allows single repeaters, but it's very unlikely the FCC wanted linked repeaters, and they're unlikely to bend the rules above to allow it. You seem to want to know 'for sure'. So, contact the FCC, and ask. NOT a local office, but the Washington DC head office, where the opinion given might actually stand up later. Local offices have been known to offer opinions the head honchos disagreed with firmly, and Washington wins these questions.

12518. re: Dan, New Member Questions!

Yahoo group: GMRS (2005 — 2007)

Topic: 12518 Message: 12518

Dan, KC0DRV this is August, W8MIA in AZ and I am an old Colorado person and know where you are located and well understand how scary no communications could be up there but you are closer to Heaven than most!!! ☐

As a Ham Radio Operator you are certain know that if you "get caught" violating the GMRS rules it could also mean trouble for your Ham radio ticket as well so with that in mind you must be careful. Just keep your GMRS op's within the rules and what others do is not going to hurt you.

Now I want to approach your question from 2 points of view. Absolute legal and what everyone else is doing legal or not. Also one over ruling FCC rule that covers everything within the emergency communications area!

Let me start at the end first and then back up. Please remember that in time of an emergency to Life or Property anyone can use any means of radio communications to call for help. As an example I have the county sheriff's frequencies as well as the S&R frequency programmed into my mobile 2 meter gear just incase of such a situation where my cell phone or 2 meter radio system could not bring the proper help to the scene of an accident, fire, natural disaster, etc.. I now live in the boonies of AZ and well understand your problems. But if a person used an FRS, GMRS even a 2 meter radio to call for help in time of an emergency this would be permitted communications!

You might even wish to check with your county (in Ft. Collins I guess) and see if they will allow you to operate under the counties S&R frequency at 155.160 MHz. This is one of the national Search & Rescue frequencies that S&R people use all of the time. It is a simplex frequency but I feel sure will have several county receiver sites offering you good coverage even using a 2 watt hand held unit.

As you know if everyone spent $85 (what a rip off) to buy their license as we have then there would be no problem at all. However I understand the cost problem as I too live in a low income, retirement area here in AZ and that cost would also shut down such an operation here. Even if the county authorized the use of the 156.15 S&R frequency which most likely they wood there is the cost of a part 90 TX-RX unit at the least would cost about $70 or more each. Again however, in an emergency an old 2 meter radio would be OK!

Now to what actually goes on in the GMRS/FRS mess! Where you are I suspect the GMRS frequencies are rather clear. I know here even living close to an interstate highway and a busy US Hwy and another very

busy AZ state hwy my GMRS frequencies are almost all clear with the exception of the FRS folks that think all 22 channels are theirs!! 95% of them never read the instructions with the FRS/GMRS radios they buy and if you mention it to them on the air they most often tell you where to stick your head. Many use PL tones so they never hear you anyway.

As you know you can not setup an FRS repeater or even an external antenna on an FRS unit. So that kills any thought of using FRS as a dependable radio system. Your next problem using GMRS is the low cost GMRS Blister Pac radios cannot be used with a 5 MHz TX-RX split for repeater op's. Therefore they can not be used as part of a repeater system and most are NOT Part 90 certified! Again not allowing their use in a GMRS repeater system! So once again you are back to having to buying a modestly expensive UHF 2 to 5 watt hand held radio. Higher priced in most cases than the VHF counterpart.

Now for what is done in the real world without any regard for the rules. Since the FRS frequencies are broken up into two groups of 7 each with a 5 MHz split between this is a perfect setup for an FRS (not in the rules) repeater. As cheap as they are you can use one unit for TX and a second unit for receive. For example channel 1 and channel 8 will make a standard narrow band 5 MHz split pair. Not nice but has been done. Everything that goes on in Vegas stays in Vegas but this system "leaked" out!

It is still a question in my mind if a GMRS licensee can legally communicate with an unlicensed FRS station??? On a GMRS frequency operating in simplex mode the FRS user would be operating illegally. On the GMRS Intersticial frequencies (FRS Channels 8 to 14) both parties would be operating in a legal mode but in two different radio services. I have searched for a rule covering this and do to a lack of finding anything that says NO I would think this would be OK. BUT????

So with this in mind this would limit your system using a hot UHF receiver (I use a MIDLAND 30- watt unit as a base station) and some TX power you might do well operating Simplex on the Intersticial channels (FRS 8 to 14) and I believe there is a 5 watt TX power limit for GMRS on these frequencies, not sure, to lazy to look now.

I have been checking this same problem out for my area and my situation is a bit better than yours in that I live on the side of a low mountain about 500 feet above a valley about 13 to 15 miles across and want to start a FRS / GMRS Valley Comm Line for many of the same reasons you have offered up. Although I have Repeater plans right now for GMRS I have found the 30 watt base with a 6 db gain antenna just great for covering most of my valley simplex. Even at 5 watts (using an old low power GE Phoenix unit) and the 6 db gain antenna it works very well communicating with ½ watt units.

In rural areas I have also setup the county approved use of fire frequencies. Very often rural fire dept's have either their main frequency or one of their simplex Fire Ground channels they will allow

use on for emergency traffic.

You might encourage all to get their Tech ham ticket. As easy as that test has become about ½ of it is just common sense. All of the test actual questions are on QRZ.com as I am sure you know.

I know where you are in Masonville, CO close to GODS highway US 34 I would often take to go up to Grand lake or Lake Granby the long beautiful way and understand being between Loveland and Ft Collins is a bit of the boondocks!

So a quick summary as follows.
To use GMRS as a repeater system takes an expensive radio and an $85 license! To use a low cost Blister Pac ½ watt radio on the FRS/GMRS frequencies is rather unreliable but perhaps worth a try as I have done. In fact since I just need a Cardioid's antenna pattern in a westerly direction I am going to move over to a Yagi 4 loop dipole setup as a cardioid's pattern.
This however assumes it is within the rules to TX with an FRS station on ch 8 through 14 as a GMRS licensee???

Other than cheating on the rules or consider moving to 2 watt MURS VHF and being allowed to use any form of external antenna, with 2 meter type coverage, you have a problem of no way to do this at low cost. If you get any good ideas in this area PLEASE let me know.

Also possibly relevant is the previous rules about what a mobile relay station (a repeater) may and may not relay communications automatically between, now vanished from the regs.

TITLE 47--TELECOMMUNICATION

COMMISSION (CONTINUED)

PART 95--PERSONAL RADIO SERVICES--Table of Contents

Subpart A--General Mobile Radio Service (GMRS)

Sec. 95.57 Mobile relay station communication points.

(a) A mobile relay station in a GMRS system may automatically (without immediate thought or action by the station operator) retransmit communications between:
(1) A mobile station unit in the same GMRS system and:
(i) Another mobile station unit in the same GMRS system; or
(ii) A control station in the same GMRS system.

(2) A mobile station unit in any other GMRS system and:
(i) Another mobile station unit in the same GMRS system as the mobile relay station; or
(ii) A control station in the same GMRS system as the mobile relay station.

(b) A mobile relay station in a GMRS system must not automatically retransmit communications between:
(1) A mobile station unit in any other GMRS system and another unit of the same mobile station, unless:
(i) The other GMRS system is licensed to an individual; and
(ii) The licensee of the GMRS system with the mobile relay station has given permission to use the mobile relay station for this purpose;

(2) Any control station and any other control station;

(3) Any other mobile relay station and any station;

(4) Any base station and any station; or

(5) Any fixed station and any station.

[48 FR 35237, Aug. 3, 1983, as amended at 53 FR 47716, Nov. 25, 1988]

It is understood that the FCC part 95 rules are a mess, and need a lot of cleaning up. Some sections refer to other sections that haven't actually existed for many years, for instance.

Perhaps again, best to look to the official purpose of the GMRS:

(a) The GMRS is a land mobile radio service available to persons for short-distance two-way communications to facilitate the activities of licensees and their immediate family members. Each licensee manages a system consisting of one or more stations.

Nothing there about trying to arrainge statewide service, etc. SHORT range service.

I feel the same way. I kinda assume anyone on the interstitials is using a bubble pack and is most likely legal. If I need to talk to them I'll often grab my own bubble pack FRS only radio and use it instead of the Real Radio.

In the real world I've never had a bubble pack interfere with me and never found evidence that I'm interfering with them. There are at least two businesses near me using the interstitial channels. I'm guessing they're using bubble pack radios.

Hi Blake,

The consensus seems to be that it's legal to use a connection made via leased line or a broadband cable connection (i.e.: Broadband service from the CableTV company) but not via a 'telephone line'. The intent of the reg in this case was to protect the telephone company's turf and not allow folks to replace their phone service with radios - remember that Ma-Bell had a monopoly at the time -- in exchange for having to provide phone service almost everywhere.

Again, there seems to be some discussion over whether DSL is a 'switched line (the "S" in PSTN means 'switched' which was intended to mean dialup). The reality is that DSL operates over your regular telephone line (a 'switched line', so it would seem to be illegal to connect/control your radio via DSL'.. but that's up for argument between the lawyers.

There's no easy way to tell remotely if the user has connected to a dialup or DSL line or via a Cable Co broadband connection unless you backtrack to the house/office and check. This makes enforcement a bit spotty.

Despite the regs that were written years ago to protect the telephone company's monopoly, technology has trumped and today you can have phone service via wireless (cell) phone, broadband, or even satellite broadband (with that annoying .5 second delay) without having to deal with 'the phone company'.

The FCC (as well as other agencies is virtually unable to write technology into their regs. Technology changes faster then government lawyers and Congress can act.

In summary, it's MY opinion (IMHO) that it's perfectly legal to connect your rig via CableTV Co broadband, but NOT via your phone line (Dialup or DSL). Again, that's my non-attorney opinion. Other users fall on both sides of the argument.

If you ask the FCC the same question on multiple days, and get multiple people (even attorneys), you're likely to get different answers/ Remember that the FCC is NOT responsible if they were wrong - just like the IRS is generally not responsible of they give you incorrect info (the complete IRS code now totals about 12,000 pages).

Federal laws and regs have gotten are so voluminous, complex, intertwined, contradictory, and confusing that you probably are guilty of a few serious felony infractions every time you leave your home ! There a literally thousands of laws still effective that reference technology that no longer exist. We still have local ordinances that state:
1) you must sound your motorcar's warning device at each intersection to

warn horse driven carriages!
2) You must carry your firearm to Sunday religious services.

For a laugh, I'll forward separately (off list) an April Fool's day 'FCC Announcement' that hits just about every year:

Not.

Using DTMF on a repeater is only allowed for programming or one-way paging.

You may send one-way messages (one-way paging) across a GMRS system, but an unlicensed person or device (belonging to that person) may not communicate back to you. This is part of your responsibility and agreement when you registered for your GMRS license.

Autopatching is not allowed because it uses a switched telephone network, which is prohibited in Part 95.127 and 95.141.

Here we have hams that talk on GMRS with
their ham radios, don't have a license, etc. Hell
in the adjacent county a group of ham's have a full
power repeater on a 'FRS' (In between)
frequency! They occasionally slip and give their ham
call. It's just disgusting! What can be done
about it? Any thoughts or suggestions would be
greatly appreciated. I have paid for a license for
many years and have invested thousands of dollars
in equipment (i.e. repeaters, portables, mobiles, etc.)
Is the fee high, yes but so be it. That is what it is so
get over it. Either pay it or go to another service. It's
just that simple. I look at it this way, it helps to keep
the 'riffraff' off. Well no as these law abiding hams
talk with their non compliant radio equipment and
no license..... Sickening.....

Craig

As a Ham Radio Operator you are certain know that if you "get caught"
violating the GMRS rules it could also mean trouble for your Ham radio
ticket as well so with that in mind you must be careful. Just keep
your GMRS op's within the rules and what others do is not going to
hurt you.

Naw.. I think I'll pass on contacting the FCC direct :P They are a nice group and all... but who needs to stir up hornets.. or for that matter, I really don't need to know.. just was curious, but yes it is my understanding according to the rules that basically it's a repeater for local use.. no auto-patch, etc.

Makes sence, I guess, as there are only what? Six frequency pairs? Not an issue where I am.. but perhaps in bigger cities.

I have an ICOM F-420, and bought my programming cable on eBay. Only cost me $25 total to ship to the door. Has the radio connector on one end, and a male serial connector (RS-232) on the other. Roughly about 1.5 feet long. Works great.

Don't recall who I got it from. But just do a simple search for "f221 cable" and see what comes up. Then sort the results by price. There may be some good deals in the Buy-it-Now sections.

Need the software? Ask me. I may have it.

I heard the term "Blister Pack" used by someone I know the other day..
never heard it before.. but good term :)

Actually, I have to admit... when I need a laugh, I sometimes turn the
PL receive of the local repeater off and listen to the bubblepackers
going on... it's especially fun when it's a group of teens playing in
the nearbypark.. they often start saying things like "we got the polic
on the frequency... " LOL.... as soon as call-signs and anything
'professional' starts going over the airways the bubblepack kiddies
run.... or get stomped on.

From: W8MIA
Topic: 12529 Message: 12529

To Dan and all others that wish to form a local GMRS radio service for personal safety, medical emergencies, other community type situations where the GMRS would fill the need for this communications service and stay within the rules set by Fox Charlie Charlie!!

Please refer to this section 95.179 below and read where it is titled: "THESE PERSONS MAY BE STATION OPERATORS:" SUB SECTION (III) "AN ASSOCIATION"

This "ASSOCIATION" could be the "Masonville, CO Emergency Service" or the "West End Home Owners Assiciation", etc.. Anyone that wants to use your GMRS radio system and is a signed up member of this group is allowed to do so just as any family member would be.

This also gives me the opportunity to use GMRS for My Church communications since we are all members of the same church association.

Just a few thoughts for your problem Dan. Also check out on the FCC web site
< http://www.access.gpo.gov/nara/cfr/waisidx_06/47cfr95_06.html> the section on Emergency Communications.

August
==========

[Code of Federal Regulations]
[Title 47, Volume 5] [Revised as of October 1, 2006]

[CITE: 47CFR95.179] [Page 517]

FEDERAL COMMUNICATIONS COMMISSION
TITLE 47□TELECOMMUNICATION - CHAPTER I

PART 95_PERSONAL RADIO SERVICES

Subpart A_General Mobile Radio Service (GMRS)

Sec. 95.179 Individuals who may be station operators.

(a) An individual GMRS system licensee may permit immediate family

members to be station operators in his or her GMRS system. Immediate

family members are the:

(1) Licensee;

(2) Licensee's spouse;

(3) Licensee's children, grandchildren, stepchildren;

(4) Licensee's parents, grandparents, stepparents;

(5) Licensee's brothers, sisters;

(6) Licensee's aunts, uncles, nieces, nephews; and

(7) Licensee's in-laws.

(b) Only the following persons may be permitted to operate under the

authority of a GMRS system licensed to a non-individual:

THESE PERSONS MAY BE STATION OPERATORS:

(1) If the GMRS system licensee is:

(i) A partnership..... Licensee's partners and
employees.

(ii) A corporation..... Licensee's officers,
directors, members and employees.

(iii) An association..... Licensee's members and
employees.

(iv) A governmental unit..... Licensee's employees.

---
(2) These persons may only communicate messages about the licensee's

business activities. Employees of the licensee may communicate messages

while acting within the scope of their employment, and only about the

licensee's business activities.

(c) The licensee may permit a telephone answering service employee

to be a station operator if:

(1) That employee only communicates messages received for the

licensee to the licensee;

(2) The station equipment at the telephone answering point is not

shared in any other GMRS system; and

(3) The station at the telephone answering service point is not

interconnected to the public switched telephone network.

(d) The station operator of a GMRS system licensed to an individual

may be a station operator in any other GMRS system if he/she has permission from the licensee of the other GMRS system.

(e) The provisions of Sec. 95.33 regarding cooperative use do not apply to or govern the authority of a GMRS licensee to designate station operators in accordance with the provisions of this section.

Good day to you.

These folks need to stop and right now! Either file a complaint with the FCC yourself or go to http://www.popularwireless.com/cgi-bin/Ultimate.cgi , join, and ask one of the PRA members in the proper forum to help you file the complaint or download a complaint form directly from the PRA and file it. You need to get these guys shut down. These "hams" give shame to the term.

Subject: [GMRS] Re: Autopatch/Communication with NON-Licensed

Naw.. I think I'll pass on contacting the FCC direct :P They are a nice group and all... but who needs to stir up hornets.. or for that matter, I really don't need to know.. just was curious, but yes it is my understanding according to the rules that basically it's a repeater for local use.. no auto-patch, etc.

Makes sence, I guess, as there are only what? Six frequency pairs? Not an issue where I am.. but perhaps in bigger cities.

12533. GMRS Repeater/Pre-Amp/Fuzz

Yahoo group: GMRS (2005 — 2007)
Date: 2007-04-04 18:18:27 UTC
From: hazmatt1981
Topic: 12533 Message: 12533

Hi,
I have a fairly decent GMRS repeater system going. It is running a 12dB antenna. The antenna is on the top of a 1,850ft mountain, overlooking the city and countryside where I live. The repeater functions wonderfully! The problem, at the moment, is that when you get to the fringe areas, you hear the repeater better than it hears you. I have put a 12dB pre-amp on the receive side, and this HAS increased receieve, however, it also is bringing in alot more noise, now... to the point where, weak signals are coming in now, but they are covered by alot of noise.. and any noise that was there, is now amplified... I know.. a pre-amp will do this.

Overview of situation:
12dB antenna.
16dB pre-amp
1,850ft mountain
Antenna mounted to fence post, slightly below treeline.

Problem:
Far-away-stations are being brought in, but it's kind of useless because , while the signal is clear and there, they are almost covered by the new noise floor level. Local stations have more noise, any time they go into a 'poor' stop, rather then just getting a little fuzz (without the pre-amp).

Question:
What does the list think would happen if I were to pad the pre-amp say 10dB?

Goal:
Have the repeater hear me as well as I can hear the repeater, but without raising the noise floor so high it creates fuzz.

12534. Public Switched Telephone Network

Yahoo group: GMRS (2005 — 2007)
Date: 2007-04-04 20:22:17 UTC
From: kvsp1160@aol.com
Topic: 12534 Message: 12534

I know that we have looked over this issue several times, but we have not dug deep into it in a while. I am not looking to argue over the rules or who's right/wrong; please do this elsewhere. If you'd like to reply to me privately, that is fine...

Most of us that understand these rules -- 95.141 & 95.179(c)(3) -- know that they were intended for that era when the FCC didn't want radio communications to jam or interferre with the telephone company, which at the time was not as sophisticated as it is now today.

With today's technology, is there such a thing as a Private Switched Telephone Network, or another way to route your telephone calls without the sole use of the Public Switched Telephone Network?

This is not in reference to controlling another GMRS repeater or station, linking GMRS systems, or by means of using the GMRS system to control other equipment. This would be in reference to DTMF Autopatching.

The only sections of the FCC Part 95 rules and regs (from 1998) that I found were 95.127(e) -- points to FCC Part 68 --, 95.141 and 95.181(j). But this only refers to interconnection from 1976, or wireline control.

For the year 2007 (not 1976), can autopatching be available for a GMRS repeater system, to only be used as a means of communicating from the GMRS system to the phone system if and when needed? I'm not looking for answers in regards to controlling, linking, and the such.

1998 Part 95 Rules:
http://www.fcc.gov/Bureaus/Engineering_Technology/Documents/cfr/1998/47cfr95.pdf

2005 Part 95 Rules (current):
http://www.access.gpo.gov/nara/cfr/waisidx_05/47cfr95_05.html

Thanks for the help. 73!

12535. Re: [GMRS] DAN, THIS MAY BE YOUR ANSWER TO NON FAMILY USE OF GMRS!

Yahoo group: GMRS (2005 — 2007)
Date: 2007-04-04 19:13:23 UTC
From: A10382
Topic: 12529 Message: 12535

Please correct me if mistaken, but I believe the problem with this analogy is that the FCC is (in general) no longer issuing GMRS service licenses to anyone other than 'individuals'.

Another poster had discovered that a police explorer group was granted a license (possibly granted before the new 'individual' license rules became effective, renewed, and therefore 'grandfathered'). However, those older licenses are, as this one was, restricted to a single frequency pair (as well as the 462/467 .675 pair) and noted in the FCC license grant (ULS System) .

How the Police Explorer group would get a teenager with their own '22 channel' (or even a real GMRS 15 channel) radio to transmit only on their licensed frequency is beyond my comprehension.

Perhaps the explorer group is using the PD's old castoff Part90 radios, which were preprogrammed only with the Explorer group's licensed freq.

The local Police Explorer post here uses FRS for comm between each other (on a site for parades, carnivals, events, etc.)/ A few of the older/more senior members are issued a VHF low band radio with one of the Police Dept's less used freqs (not the dispatch channel) for comm between the event site and HQ. The explorer post receives a written MOU from the department to cover this.

This IS a small town (population 7000), 25 sq miles, but with a lot of rolling hills - making LowBand VHF still the best choice for good radio coverage. Radio equipment has gotten better (and less expensive) over the years, but when it comes to propagation the 'old' laws of physics still apply and cannot be overturned!

From: Dan Fink
Topic: 12536 Message: 12536

Thanks for all the information, skip and august! I didn't expect a pair of lengthy essays to answer my question. Great folks here, glad I joined.

In reading all of this and contemplating, my plan for now is to:
- encourage any and all up here to get their Technician ham licenses.
- monitor FRS channel 1, 24/7 with my big quad band radio and 70cm antenna.
- for normal communications, then talk back to those folks on my FRS radios.
- in a true emergency, blast FRS channel 1 on my big radio at 30 watts and damn the torpedos.
- when my GMRS tag finally comes and I get a radio, do so on that instead, and work with other licensed GMRS operators up here to get a repeater set up.
- watch for used GMRS base stations and repeaters used.

The whole GMRS - FRS deal is really confusing. I know some of our neighbors have bubblepack radios that are not legal, the set I bought for fishing trips has a little piece of paper about 2 inches by one inch that mentions in fine print you need a license. I won't come down hard on the neighbors, tho -- in these high mountains, you can't get more than a mile out of a 1 watt illegal radio anyway. But what a stupid deal -- what was the FCC *thinking*??? At least UHF doesn't propogate like 11 meter does for CB radio. That band became useless decades ago.

Oh, and:
- tell the illegal bubblepack folks to just get their GMRS tag and then buy a real radio that can pump out some watts!

The one thing I really like about the whole GMRS-FRS deal is that licensed and very importantly *experienced* radio operators can at least monitor and talk back to local folks (and kids) on FRS. That's a GREAT idea. The whole FCC implementation is what's messed up. A kid lost in the woods with a cheap FRS from KMart could get help up here really fast.

Thanks again, folks ---

And August, I'm in the canyon between the Big Thompson and the Poudre that nobody knows about. But I bet YOU know which one it is! Cheers.

DAN

You beat me to the punch A103... You are correct, non-individuals are not eligible for new licenses. Existing licenses may be renewed via a grandfather clause but the system may not be changed in any way...no additional radios, no addition of a repeater, can't move the repeater to a new location, etc. If you look at the original posters quote of the regs, you'll see he is looking at a 1983 version. There have been quite a few changes since then.

I think your going to keep asking until you get the answer you want to hear. Or your going to do what you want to based upon how you read the rules. But when you receive that letter from the FCC asking you to explain why you violated their rules or fining you thousands of dollars, remember that you asked and many attempts were made to help you understand that what you wanted to do was illegal. Please then don't come back crying that you couldn't get answers!

The answer is NO. It hasn't changed. No matter how many times you ask.

GMRS units may not, not, still NOT, be connected to anything for any reason other than positive control of the GMRS radio itself. NO audio linking.

The service is not a replacement for phone service. If you want a moble phone, BUY a mobile phone. GMRS is designed and intended, now, for the personal, short range, local communications of a family.

You want to ask? Then go ask the FCC in Washington! That's the only one who can answer you 'Yes' and have it mean anything.

Yes, I'm getting hard bounces constantly, and constantly having to renew my membership with Yahoo Groups. Yahoo has been having some serious problems with the system they have recently installed, and they keep saying that things will return to normal very soon - but that was about 10 days ago. How long does it take?

I have had to "unbounce" myself 7 times now, and I am getting more than a little flustered. While I appreciate Yahoo Groups greatly as a means of exchanging information, I may not "unbounce" my group account again if it happens once more. I have little time to spare for this. You would think that Yahoo would have these problems solved quickly. Lets hope that yesterday was the last email from Yahoo Groups to reactivate my account.

Actually, this is just a supposition that some on this list have made, even though the FCC could care less about it since the 1968 Carterphone ruling.

I think the FCC just did not want to see the band clogged up - and felt that there were other UHF frequencies available for interconnect.

Well, besides the two rude and not-so-helpful replies I got today (which did not help me come to my decision), I have decided to find out via another way.

I thought that we could look through the rules and work this out instead of fighting over dates and why the heck I 'feel' like doing this in the first place, or telling me otherwise.

But for those who have helped, I do appreciate your time and information.

I dunno why you thought you could get a good answer here . . . or one
that you want.

If you want the *best* answer, then go ahead and start doing it, let
people complain long enough (don't expect a quick retort), get your
letter from the FCC, pay the fine and be done with it. Others have gone
this route. Paying the fine would just be a cost of doing business and a
cheap one at that if you are smart enough to charge for cheap cell phone
access. You might get 18 months out of it before the FCC sends a letter.

If you don't want to risk a fine, then don't do it. <shrug> Makes no
diff to us. It's only money.

This will prove futile. With your base antenna, you'll hear transmissions from several miles
away - much farther than you'll be able to legally transmit.

> - in a true emergency, blast FRS channel 1 on my big radio at 30 watts...

Silly. Immature. Illegal, too. You need to come up with a better emergency plan than this. Something coordinated, calm, rational - and legal.

It's been working quite well for 3 months now. Our community is in a remote, mountainous area. I hear at most one or two spurious, long-distance transmissions a day. I'm located on a ridge top, and have nearly direct line of site to the FRS stations that are concerned about emergency response. We are easily getting 2 miles in the situation, which is plenty.

> > - in a true emergency, blast FRS channel 1 on my big radio at 30
> watts...
>
> Silly. Immature. Illegal, too. You need to come up with a better
> emergency plan than this.
> Something coordinated, calm, rational - and legal.
>
> Clint Bradford, KAF3359

My understanding, from both my ham license and my sheriff's department communications license, is that I can use any means neccessary to communicate during an emergency response. If the injured party is reporting the incident via FRS, I can legally use any power level to communicate with them on FRS, and even patch their FRS transmissions into the ham bands for a phone repeater to 911 dispatch, or directly onto the fire and EMS frequencies if sheriff's 911 dispatch requests it.

We do not have phone lines or cell phone service in our response area. If you every get into a motor vehicle accident, have a heart attack, or get caught in a wildfire, this "immature" person is the one that will be rescuing you! I'm NOT fooling around, perhaps you did not catch the fact that I'm an officer in a rural fire department?

My intention with the original posting was to find a way that local residents could have a radio system with which they could communicate non-emergency radio traffic, while still having a way to reach sheriff, ambulance and fire responders during an emergency. I carry Ham, GMRS, and Sheriff's department radios with me at all times. I'm sorry I somehow offended you, Clint, but the FCC rules change quite drastically

during a life-threatening emergency. I can (and do) even use bubblepack GMRS radios without a license during such an event! (grin)

I would love for you to point out at least 3 facts on how I have broken the rules since I have been licensed. And I want you to point out at least 3 facts on how I experiment with GMRS.

You haven't met me personally, you don't know how my organization is operated, you certainly haven't seen my equipment or my work done on other equipment.

All you do is take words from my mouth, twist them, and use them against me to discourage myself and others out there who try hard to improve and support GMRS.

I've done nothing wrong on the group (or any other group), and I use references from the rules with all my answers to support them. I've also helped many individuals who are new to this group since I've joined back in 2001. And not once have I violated any rules or actions on this group in my membership period.

The group is here for suggestions and opinions only. Your judgements against myself and comparing myself to others is not fair and not appreciated.

This was a simple question. You did not have to participate publically in the group during this thread if you felt that the questions I was asking were inappropriate or stupid. And I wrote clearly at the begining, if you wanted to talk with me privately about it, then to do so and not argue about it on the group.

Those are my thoughts; I have said them; I expect that if you have further personal issues with me, to responsibly write to me off of the group.

've done nothing wrong, or said anything against you. So why do you attack me?

From: Danny Harmon
Topic: 12534 Message: 12552

I have to agree with CRaig on this one.
This persistent interest in making GMRS some sort of alternate Ham service is quite frustrating. I really wish the hams would keep all this hobby stuff over on the ham bands where it belongs and off of GMRS, where users merely want it as a tool for communication.
We don't have any problem with this here in my area, but it sounds like some markets are overrun with it.
Also, why on earth would anyone want to use two way radio for telephone interconnect when cellular is so reliable and far cheaper?
Answer: there iS no good answer other than "I thinks maybe the hams want to tinker with that phone nonsense on GMRS, clogging up frequencies and totally misusing the service."

You are misinformed. You may use any means of communucations if and only if there is an imanant (sp) danger of loss of life or destruction of property and there is NO OTHER MEANS AVAILABLE. This topic has been hashed and re-hashed. Having a badge whether it be a sheriff or fire dept or FBI for that matter doesn't give an unlicensed person free rein on the air waves. There is a rule in part 90 regarding law enforcement being able to use any frequency under the FCC's jurisdiction when conducting covert operations however there are restrictions about this...5 watt limit is one I think and the FCC has to be notified in writing within a certain period of time.

If you want to get your residents radios, then get licensed under part 90 and get your residents some radios and that way, you'll be legal.

I see that you are a ham (I didn't look it up but assume it's valid). For someone that has taken the time to study the regs and supposidely hold a to higher standard, I can't belive that you would propose this illegal activity. If you got caught, you can kiss your ham ticket good by. For that matter...why even renew you ham license when due. Just go ahead and talk away and to heck with the rules and get yourself a CB with a 1500 watt PA.

This is why I put "owns" in quotes. Basically they frequency camp on .600 in NY.
You are correct. I monitor many times of the day, and not just for 5 minutes usually. I have never heard them do anything "official".
They do sound official, but it is ALL idle chit chat. Their families, cars, what they are having for lunch, etc.
Don't get me wrong. This is ABSOLUTELY fine. This IS what GMRS is all about. I'm just not sure why they need an elaborate buff group setup to do this.
Another thing is their systems are so powerful, and they are on the air so much, that no one else within over a hundred miles can even consider using the freqs they are on. IMO this is NOT what GMRS is all about. I don't consider 100 miles "local".

Cell service is not reliable during an emergency, and it still
has holes in the coverage.

Not that I am for GMRS having interconnect, I just think your
arguement against it is full of holes.

Your understanding here, from actual response by the FCC to those who made this sort of mistake on the air, is wrong.

At MOST, the FCC 'tolerates' use of unauthorized frequencies/power in life or death emergencies, or, as the San Diego office put it, 'Their boat damn well better be on fire and sinking!'. (more or less)
By 'life or death', they mean seriously, right now, someone is GOING to DIE if you don't DO something, and there is NO other 'legal' alternative.

What police and fire call an 'emergency response' is NOT an FCC 'emergency'.

Use frequencies on your ham gear that you're not authorized to use as a
ham, EVEN if you're authorized to use them as a sheriff, or whatever, and you will be cited, and risk your ham license. The FCC has shown no
tolerance whatsoever for this sort of operation.

You do what must be done, of course, but don't go thinking the rules allow it.

YOUR Sheriffs department communications license? Pray tell, what
are you talking about?

You may interpet the FCC rules to say the above, but the FCC does not. Case
in point would be the HAM in CA that got into trouble for using his HAM HT
on the SO Admin channel - who lost his equipment because of it.

We're totally off-topic now, but I can answer this question. I am both an Amateur and a GMRS repeater owner. Why do I use two-way amateur radio to make calls, even when I own a cell-phone?

ANSWER:
1) Sometimes I am outof range of a cell-tower, but yet can easily hit the amateur auto-patch, even with an HT.
2) Cell phone audio is horrendous, even when I'm in the city, I have been known to use the auto-patch to make quick personal calls, because the cell phone audio is just nasty... all compressed and warbled (digital yuck!).
3) Cell phones are not reliable. The local auto-patch is. Unless the tower has fallen over, that repeater is up and on the air with auto-patch. My cell phone sometimes locks up, sometimes the signal drops, etc.
4) Cell phone are NOT cheaper. A basic cell phone plan costs $39.95 and that includes very few minutes. An amateur radio license costs $14.95 at at the most (one-time fee).

Those are my reasons :)

Well I dissagree on several points.
In the first place this conversation is NOT "way off topic". It's dead-on to the GMRS question.

The only arguments hams have come back with is about reliability and use in emergencies. Those may be valid points...for ham radio , but as I stated initially, GMRS is NOT HAM radio and SHOULD NOT BE TREATED AS SUCH.
Sure your ham radio PBX interconnect is "far more reliable than the cellular network and is cheaper than a basic cell package"...

...as long as you don't mind five hundred people listening in on your conversation... and what about recieving calls??

But now you're right...this is Way off topic.

Back to my initial point: Keep the ham stuff OFF GMRS, please.

Thanks,
Danny Harmon
Tampa

I agree

There are many rurual areas where the 3 watt mobile phones have spotty coverage and the handheld phones make better flashlights than telephones.

Quoting Blake Bowers <bbowers@...>:

Topic: 12569 Message: 12569

I caused a bit of a disturbance with my new member question last week. Lest anyone else think I'm not serious about the (boundless) practical applications of the GMRS band, I am now:
WQGS890
and
KC0VRD

My pair of pirate 1watt FRS/GMRS bubblepack radios (with the 1 inch by 1 inch tag in the packaging saying "you need a license") are now legal for when I go fishing with my elderly father (they've been stored in the closet since I read about them on the PopularWireless FAQs). I can now talk to the neighborhood kids on FRS, and if they have an emergency I can both legally talk back and call for help on ham or fire bands.

Next up -- a pair of REAL GMRS HT radios at 5 watts for fishing with Dad. And a base station for public safety issues, ordered the parts for building an antenna today. And so on!

Needless to say, it's pretty exciting. I was mortified to read here about the problems unlicensed bubble pack radios are causing for many of you folks -- never ran into those issues because I am in such a remote mountainous area with bad propagation, but that's why my bubblepacks have been in the closet since I bought them.

As for Ham operators who "blast" onto your bands -- I fully understand the prevailing attitude here about that. It darned well better be a real, life-threatening emergency if they do that!

DAN

Paul, if you read back in my replies you'll see I did make it clear
that I was talking about eastern NY. I am from NY (originally from
LI); I know the difference between "The City", the North country,
Western NY, etc. I have the same feeling as you about non-New Yorkers.
It's quite annoying.

I made the Bluecomm comment because they seem to camp on .600 here and
thought they were a statewide/national group. I see now they are LI
based and not statewide.

Hello everyone, I'm new to GMRS. I haven't done anything at all yet. I was looking over the radios on ebay. They have come down in price over when these all first came out. I was reading some old articles I have, and it also seems that the wattage limits has risen too? Any advice or thoughts would be appreciated on getting started. Thanks.

The power limits haven't changed any time recently, no.

In order to help you, we'll need to know what you want to accomplish with GMRS. In family chat at campouts, vacation spots, and the like? That's what GMRS is intended for, primarily. Mostly you'd be using handie-talkies for that either the cheap ones if you don't wish to spend very much, or somewhat more expensive ones like the ICOM IC-F21GM if you want better quality stuff that'll sound better and probably work a bit better.

If you want to keep in touch with the family at home from your car, that's assorted commercial radios (of the low end types) suitable for GMRS, at up to 45 watts. Range is highly dependant on how high up the antennas are. Home to car at 45 watts with a home antenna at 25 feet up probably means reliable range of 7 miles or so, with 'possible' out to 15 or so. If your home is up on a hill, range will be farther if nothing (other hills, buildings, a lot of foliage) is in the way.

GMRS isn't really a 'general chat' sort of operation, with folks just calling at random to chat with others. It's pretty much used for specific needs. There are groups that put up mountaintop repeaters which can extend your operating range nicely, and if your needs involve covering a 50 mile radius or somesuch, you'd probably want to find such a group in your area. They share the costs of running the system, which can be a bit costly, with site rental fees.

You must, of course, have a license to use GMRS, which is currently $85 for a five year term, but it covers all members of your family, so you normally only need one.

Hey Steve,

I have 3 GM300s tweeked out to 47 watts tx power and they have a real good reciever. One is a base with antenna tip just above 40ft. I live in Texas and get a mobile to base range of 20-25 miles on a reliable basis. I have two 5 watt ht's that on a good day gets a range of 7-8 miles. I have a friend on the other end of the county that has a HT connected to a 30ft base antenna, he gets about 15 mile range on his system. Don't believe what the bubble packs tell you on range.

I like the motorola stuff, because I worked in public safety for 25 years and you can find some good deals on ebay, just be careful...Also take your radio tech to happy our after work, then you got a friend.

Well, if you get Moto stuff you'll need a friend in the radio business. Moto is infamous for NOT wanting programming capability in the "wrong" hands. By wrong I mean anyone not in the radio business.
Yes, their stuff is top shelf, I just don't like their communistic stance on programming.

Peter,

Yep I understand your frustration with motorola and their way of doing business. I have spent a lot less on a few brews once a week than what it would have cost me to get the software the right way or the wrong way, plus I have even got a little OJT from my tech buddy on the software. Then again it may be the local dealer, if you buy a radio from the one here in Central Texas they reprogram your radios for free if you ever need it.

r.
The ham radio rules are way simple
r.
So My questio
n
s

I see 50 watts max for GMRS but when and what and where
.

So assuming this is a repeater system, simple questions and hopeful
ly simple answer
s
.

A mobile for repeater use I assume is limited to 50 watts or is
it les
s.
I assume the repeater output is limited to 50 watts or is it les
s?
What is my base station allowed for wattage in order to talk into t
he repeater? Is the base considered a fixed station or small ba
se statio
n
.

I see all this in the r&r but really don't see or comprihind how
it all fits together
.
With that said we hope to get a GMRS repeater on the air one day f
or all our spouses who refuse to get a ham ticket. We live in
a mountainious area (Santa Cruz Mountains California)and a repeater
is essential. So we of course would like to know what we can use. If o
ur bases are limited to 15 watts we should probably tie our spouses in
a chair and make them learn to be a ham. To hit a repeater at the oth
er end of the valley here in the 440 band needs some power even to g
et into. 35 watts does not always make it. We have many high level 4
40 repeaters in the area so the paths are well teste
d.

I run into another GMRS er at a hamfest over the weekend and he had picked up a couple of Ritron mobile radios. They are black and look real good, front speaker, controls etc... and 30watts tx. Picked em up for $100.00 each and has a red programming chip. He hotwired to his truck and it sounded real good and the meter he had was reading 32 watts tx power. I got home and looked them up on ebay and found a few for sale. Just another option!!

Good day to you Greg

Power output is limited to 50 watts TPO for mobiles, regular base stations, and repeaters. A "small base station" is defined as one that has no more than 15 watts and they have height limitations.

Regular base stations and repeaters have no height restrictions save the FAA. Also, regular base stations and repeaters must maintain at least 2.5ppm frequency stability whereas mobiles can maintain 5ppm...without pulling out the rules, I think small base stations can maintain 5ppm as well.

Gain antennas are allowed and there is no limitation on the amount.

All radios must carry Part 95 Certification.

Hope this helps

Hi Bob and Greg,

Just a short correction - according to FCC Rules and Regs 95.135(e):

(e) A small base station must transmit with no more than 5 watts ERP.

<http://a257.g.akamaitech.net/7/257/2422/13nov20061500/edocket.access.gpo.gov/cfr_2006/octqtr/47cfr95.135.htm>

When Bob said "15 watts", I remembered it as only 5 watts. I also thought it was 5 watts TPO (total power output). When I looked it up, I was surprised to learn that it is 5 watts ERP for a "small base station".

Might also note that all GMRS stations are limited to 5 watts on the
interstitial channels shared with FRS.

The only problem with GMRS is the number of operators. There are few enough operators in the two meters area. I also know, and I hope someone could correct me here, it is possible to set up your own repeater, and allow others to use it , I know of only one such repeater, and the guy who put it up has nt had the ability to maintain it, so it is off the air most of the time. Are there clubs within the State of kansas?

John,

I have come up on the repeater a few times and not heard anyone.
I do keep it in my scan list though...

Do you still have the other machine for sale?

I would need to know if at the time of purchase it would be ready to go on the air? I know I would need feed line and an antenna, but other than that..

well the R-100 repeater is still on the on the air it is set for 462.725 and has a DPL code of 125. Yes I would still like to sell it. It would need a duplixer as in it set up now there is a TX and RX antenna. I would sell the repeater for $100.00

Also I have the 700 and 725 in my HT on scan so If you catch me that is great and we can talk. One problem there is about 10 Freg in scan so it take a bit of time to do the scan list about 4 sec. Sometimes at work it get on the work channel and I forge to get it back on scan.

Thanks and hope to talk soon.

John

GMRS is big in SE Texas for REACT and such. There are quite a few repeaters.
Yes, you can build a repeater and put it up. 50watt limit and I can't
remember the height limit.
I want to find a place to buy used Motorola radios for GMRS.

Hi Vernon,

It is true that in many areas GMRS is not very active. I have found that some GMRS'rs have scanners and scan all 8 freqs. It is up to each person to generate interest. The problem is that if one licensee puts up a repeater and then wants to keep it private because of fears of over-use, it won't get used because no one will know.

I regularly get on my repeater and announce its presence, PL, location, coverage etc and then give a typical HAM type listening call. I have had several contacts from other GMRS operators who were scanning and heard me. Other than that even my own use has been limited as I used my coax for my 2m rig and am waiting to receive another shippment of feed line to get GMRS on the air.

As a REACT team member I am interested in ALL the public licensed and unlicensed bands, CB, FRS, MURS, GMRS and ARS.

I think GMRS can be what we as operators and licensee make of it but that is the risk. What a great problem it would be to have a well used repeater, LOL.

There are very few GMRS repeater databases out there and not everyone wants their repeater listed so that makes it tough. You will just have to scan the GMRS freqs and then jot down the callsigns and look them up at the FCC ULS -->>
http://wireless2.fcc.gov/UlsApp/UlsSearch/searchLicense.jsp

Go ahead, look yourself up. Look me up. Let's have some chatter there in KS.

John, everytime I head to the west (Tampa) I use your repeater. I have the same luck with both the repeaters we have on the air. We have a few that use them everyday.
I hope you keep the 700 repeater up and running. It would be well worth having if the Tampa Bay area gets slammed with a hurricane and it make's it through the storm.

12600. A few questions ...

Yahoo group: GMRS (2005 — 2007)
Date: 2007-05-10 02:53:55 UTC
From: omnisound_radio
Topic: 12600 Message: 12600

Fairly new to GMRS, but know my way around communication devices quite well. I am in the process of putting together a repeater. What I have accumulated so far is as follows:

Kenwood TK-805D (to be used as RX)
Kenwood TK-830 (to be used as TX)
Relm RC-450 Preamp
Sinclair 4 Cavity Duplexer (already tuned to my freqs and ready to rock)
GE 30amp Continuous Duty Rackmount Repeater Power Supply
KLM/Mirage Base Antenna
9913 & rg-400 cables & jumpers

Think I have pretty good start here. If I'm wrong, someone please correct me. I will be using an ICOM F4TR HT hooked to a TPL 50W amp for mobile use (this TPL model is part 95 certified). Have an Antenex 5dB antenna on the roof of the car. In the proximity of the repeater site, a Midland G-28 2W HT will be used to talk-thru the repeater (a way around base limitations?).

Here's the questions ...

I have read some articles about potential illegalities of using certain repeater controllers. Not sure how that really plays into all this. I was planning on throwing together a PIC-based controller and insterface directly with the mic jacks - no internal mods. Can someone enlighten me why I would need to be afraid of doing this FCC-wise? Can anyone suggest as to a reasonbly priced manufactured or kit controller that would provide proper ID at 10min intervals and accept DTMF control commands?

I wish to have a phone connection to be able to kill the repeater remotely. Obviously this requires an FCC approved device to connect to the switched phone system. Anyone have any recommendations? This is the ONLY reason for having the connection to the phone line. A suggestion wss made to me about using cell phone instead, but that's not really practicle.

One other less pressing question has to do with interfacing SAME emergency alerts to repeater. Is this legal?

Any help, suggestions or info that anything I've outlined is in an FCC grey area, please let me know. If you haven't figured it out, I'm taking GMRS very seriously.

Thanks!

- Jeff

12601. Re: Licensing stations, repeaters and RF Power output limitations

Yahoo group: GMRS (2005 — 2007)
Date: 2007-05-11 03:35:33 UTC
From: Greg KI6BJI
Topic: 12580 Message: 12601

All right thanks for all the info. I presently have a GMRS repeater and have just purchased a community controller for it. Still need a diplexers and power supply. I also have two Motorola 45 watt Maxtracs that I have been using as UHF Ham rigs. Are they part 95 certified and be used for GMRS? And if so will they sustain the 2.5ppm frequency stability for use on a base? We hope to place the repeater at a high level location. In fact the area we are looking at may result in a several hundred mile coverage area. Everyone I have talked with so far can not give me an answer if the maxtracs are legal to use. Once they are programmed that's it for the end user but I see some are using the Kenwoods that can be programmed from the front panel. I hate to think I will have to use a radio other than the maxtracs for our mobiles as they are easily modified to use a remote head setup. I can always use a HT at the base if we get the coverage we are looking at.

I don't believe 'automatic ID' is allowed, though that might be
wrong. I do know it's normally not done around here. All GMRS
repeaters must have live, on the air control operators during
operation. Most of the 'controller' problems revolve around linking
controllers that allow tying repeaters together with each other or
weather transmissions or whatever... none of which is allowed for
GMRS repeaters.

The actual connection device required is a mystery to me, too, but
it's legit for GMRS to be controlled by landline, as long as ALL that
landline connection does is control (turn on/off) the repeater. You
cannot feed audio to the repeater via landline, only control
functions.

>
> One other less pressing question has to do with interfacing SAME
> emergency alerts to repeater. Is this legal?

No. No linking, none whatsoever, is legal for GMRS repeaters. Not to other GMRS repeaters, not to Weather, not to any audio but the regular input frequency GMRS stations using the repeater.

http://www.lbszone.com/content/view/1906/2/

[snip]

The Rino 520HCx and Rino 530HCx also feature an upgraded processor for faster map drawing and route calculation. Like its predecessors, these five- watt Rinos boast up to a 14-mile communication range, mini-USB interface, and built-in auto-routing basemap. The Rino 530HCx has the same features as the 520HCx, plus a seven-channel weather receiver (with automatic weather alert capabilities), an electronic compass and barometric altimeter.

[snip]

The use of GMRS frequencies in the United States requires a license from the FCC. Applicable regulatory agencies should be consulted prior to using the Rino radio outside the United States and Canada.

The Rino 520HCx is expected to be available in June 2007 and has a manufacturer's suggested retail price of $449.99. The Rino 530HCx is expected to be available in June 2007 and has an MSRP of $499.99.

Hi All,

I've been on Gmrs for a few years now. I have my lic I'm using a Moto T7200 HH. I not really picking anyone up here in Bklyn, NY. I used it while going down to Va.last year and to NC the year before. I'm wondering if it really pays to go looking for a better radio and am I actually wasting the 75.00 for the lic. Any suggestions?

I and most everyone that I know has a controller on their repeater for CWID and DTMF use. They also use it as a community tone panel controller. Just make sure that hooking it up to the mic jacks is compatible with the controller you want to use (vs internal connections). Have a controller in mind?

Using a telephone to shut off the repeater is not a good idea (and not legal, per say), but you can program the controller to accept DTMF codes (over the air) to do the same. Works just as well, and you don't have to rely on being around a phone 24/7.

Interfacing emergency alerts to the system? Not sure what you mean... But you may not re-broadcast NOAA or other radio services onto a GMRS system, or tone bleeps indicating an emergency.

Equipment looks good and in order, but be careful on where you connect the RG-400. Sometimes due to faulty connections or even old internal braiding, it may cause more damage to your system than you think. Test all cabling out with a birdmeter or similar meter before you hook everything up.

Glad you found us and that you're enjoying GMRS right off! If you ever need anything, just ask...

Down in the City (and LI & Jersey) there are a LOT of GMRS repeaters.
I'm sure you can get permission to use at least some of them.
Your little bubble pack radio is fine for simplex family type comms,
such as the beach, amusement park, shopping, etc.
You should look into getting a decent commercial quality radio that will
do repeater splits, such as an Icom F21 or IC-F40.
This will open up another whole world to you as far as GMRS is
concerned!
You have the license. Use it to your advantage.

Fred, depending on what you are trying to do, you might be wasting your money.

Pay the $5 to get a Ham license instead, and start using all the FREE
2 meter and 440 MHz ham repeaters instead.

Good luck,

Well from my experience the last 4 months I would have to agree with
Kurt. I have made several trips between Austin, TX & St.Louis, MO.
and have made many more contacts on 2 meter and 440 machines compared
to GMRS. My ham ticket was only $15. But I use GMRS with the family.

From: Michael Cornwall
Topic: 12612 Message: 12612

Hello all,

I'm new to the group. I'm a ham and GMRS licensee. I just acquired some Icom F21GMs and have a problem...I can get into the local repeater here but cannot seem to hear it except on a ham rig that is listening to the output with no PL set to open the squelch. Will these radios do a PL transmit without the PL on receive? If the repeater doesn't transmit the same PL tone it needs to receive...am I out of luck using these handhelds?

Thanks in advance. This seems to be the only general interest GMRS yahoogroup that has any message traffic at all. I hope to get better informed here.

Here is a dumb question:
If you can hit a 440 repeater with an autopatch, why not dial up the non-licensed members of the family on either their landline or their cell phone?

Try setting the radio to "Audible Condition" as described on page 21 of the manual.

If I read the manual correctly this means you'll still transmit the tone but receive with carrier squelch.

Topic: 12612 Message: 12618

I never actually tried it with the radio until a few minutes ago. At least on mine pushing [MON] and holding for a couple seconds after the beep and then releasing it leaves the radio in CSQ mode. I experimented using an F21GM, a Motorola T6400 as a transmitter and a Pro-96 to monitor the PL tone.

I also just realized that my laptop emits enough QRM that I need to set the squelch all the way up when it's in "Audible Mode".

The radio forgets that it is set in Audible Mode (CSQ) when shut off and switched back on so this procedure needs to be repeated as needed.

I found the Icom manual in need of some editing. I re-wrote several pages of the manual for a friend who has trouble with anything much more than a light switch

Maybe the support guy was thinking about setting one tone on transmit and a different tone on receive (which some radios will do but the F21GM won't) rather than transmitting a tone but using carrier squelch on receive.

Well the business grade of the F21 lets us put in different TX and rx PL or SC and PL.

He was wrong. <grin>

You can't FIELD program them for split tone, as entering a tone will
reset it to tx/rx same tone, but you can program the radio to use split
tones with the ICOM CS-F11 programming software and cable.

You can also turn off the timer on the monitor 'tone squelch off'
function so it stays off until you turn it on again (or turn the radio
off and on), instead of lasting only 30 seconds as it's set from the
factory.

I did further testing last night and found that the repeater in question passes the tone thru so I'm OK. I was in a bad spot for receive on my second handheld. All seems to work OK now at least as long as that repeater keeps passing thru the tone. Thanks.

As others have described, turn on the radio and set it to the channel you want. Push and HOLD MONI through the beep and into the static, then release. You are now set for ":no tone" RX. The radio does "forget " though so you have to do it each time you turn it on.

To go back to tone squelch, just push MONI until you hear the beep.

As they come from the factory, the IC-21GM sets the same CTCSS/DCS transmit and receive. Pushing and holding the 'monitor' button turns the CTCSS squelch off, but again, as set from the factory, the CTCSS turns 'on' again in 30 seconds.

First note, of course, did you ask permission to use the repeater? GMRS repeaters are private, and you must have permission of the owner to use one. Normally they can tell you if there are any special 'tricks' to accessing them. Repeaters that have, as the one you're running into appears to, different CTCSS/DCS settings on transmit and receive tend to be the more 'private' of that group, since they usually did it to shut out 'casual' users.

Now, that said, it IS possible to program an IC-21GM to use split tone operation, just not without using the appropriate ICOM programming software. The radio is just an IC-21 that's been set up at the factory for its GMRS role, and the channel selector switch modified to make channel '16' a scan position.

Anyone with the approptiate (CS-F11) Icom software and programming cable can program the radio (in MANUFACTURE mode) for split tones. You can also reprogram the timer function that turns on the tone squelch after 30 seconds to leave it off, by setting the 'B' timer to zero.

Yes, of course I have permission...we have a group with several repeaters in it and joining the group gives permission. Thanks to all for their info...I may look into programming software and cable.

> same PL tone it needs to receive...am I out of luck using these handhelds?

As they come from the factory, the IC-21GM sets the same CTCSS/DCS transmit and receive. Pushing and holding the 'monitor' button turns the CTCSS squelch off, but again, as set from the factory, the CTCSS turns 'on' again in 30 seconds.

First note, of course, did you ask permission to use the repeater? GMRS repeaters are private, and you must have permission of the owner to use one. Normally they can tell you if there are any special 'tricks' to accessing them. Repeaters that have, as the one you're running into appears to, different CTCSS/DCS settings on transmit and receive tend to be the more 'private' of that group, since they usually did it to shut out 'casual' users.

Now, that said, it IS possible to program an IC-21GM to use split tone operation, just not without using the appropriate ICOM programming software. The radio is just an IC-21 that's been set up at the factory for its GMRS role, and the channel selector switch modified to make channel '16' a scan position.

I'm wondering if this 30 second feature has changed. I set mine into the "audible mode" and it stayed in that mode for almost 30 minutes. The manual makes no note of a 30 second (or 30 minute) timer.

Dunno, but that's the way mine came from the factory, till I changed it. Possibly they fiddle with it from time to time without mentioning it in the manual.

I suppose that unless you need to set up a split tone channel, you wouldn't care about the 'audible' feature much anyway, since the tone would be right for it in the first place. And if you get the software to deal with one, you can deal with the other if needed.

12628. GMRS Mobile Rigs ?

Yahoo group: GMRS (2005 — 2007)
Date: 2007-05-21 22:38:37 UTC
From: Chris Catotti
Topic: 12628 Message: 12628

Can anyone suggest a good GMRS Mobile to put in the two family minivans?

Desired features are:

- Full 50 or 40 watts RF out on GMRS-only simplex
Channel MHz
1 462.550
2 462.575
3 462.600
4 462.625
5 462.650
6 462.675
7 462.700
8 462.725

- Full 50 or 40 watts RF out on GMRS-only repeater-in duplex
Channel MHz
1 467.550
2 467.575
3 467.600
4 467.625
5 467.650
6 467.675
7 467.700
8 467.725

- Full 5 or 4 watts output on GMRS/FRS shared simplex frequencies
Channel MHz
1 462.5625
2 462.5875
3 462.6125
4 462.6375
5 462.6625
6 462.6875
7 462.7125

In addition, the ability to have GMRS-only repeater duplex pairs programmed on separate "channels" from simplex would be nice

Also the ability to turn off and on the subaudible squelch tones would be nice.

Any recommendations?

Thanks!

Chris Catotti.

I have been quite satisfied with the Midland 4032 radios (in use a little over a year). Our family system includes three 4032, two mobile and one used as a base station. These are 32 channel programmable radios (I would suggest purchasing the software with the radios. These units areavailable for about $280. There are also some nice ICOM mobiles availlable in the same price range.

Mike, I use the F221 from Icom. Great unit and very user friendly with the software. You can program all the channels you need plus many more (128 channel capacity) . You can alsoprogram the front panel P3 button to go simplex on the repeater frquencies and maintain the pl. I have found that the Maxrad 3db steel NMO antenna works best for my applications.

Many friends use Kenwoods as well. I understand they are end user friendly as well.

Good Luck.

John

John,

I have come up on the repeater a few times and not heard anyone.
I do keep it in my scan list though...

Do you still have the other machine for sale?

I would need to know if at the time of purchase it would be ready to go on
the air? I know I would need feed line and an antenna, but other than that..

The only problem with GMRS is the number of operators. There are few enough operators in the two meters area. I also know, and I hope someone could correct me here, it is possible to set up your own repeater, and allow others to use it , I know of only one such repeater, and the guy who put it up has nt had the ability to maintain it, so it is off the air most of the time. Are there clubs within the State of kansas?

Hi Everyone,

I'm in need of help of finding a new or used duplexer for our repeater system here in CA. We have a limited budget of under $200. We'd like it to be a BpBr if at all possible to meet the requirements for a commercial repeater site.

With the duplexer in place, all we have left is to complete our contract with ATC and our system should be on the air in the SF bay area very soon.

I do have heliax and other equipment to trade if necessary.

Thanks in advance for any help you provide.

Joe, I was just at the House of Mouse earlier this month. There are a few repeaters working in the I-4/ I-75 area.

You can contact them for access by going to mygmrs.com and looking up the repeaters in Florida. I had luck with one around Disney on 625 w/141.3 pl. This repeater uses an ID. I beleieve it is one of the old Disney repeaters or it could be a React repeater. If you contact the repeater owners on the others they will usually give you access if you provide your Call Sign and length of stay. Every once in a while they will check in with you when you are there to see how you trip is going. Concerning I 4 you can get coverage by hopping repeaters all the way to Melbourne FL.

Hope this helps,

John

Some useless GMRS Trivia...

Back in the mid 1970's I was in a REACT chapter in Miami. We had a Carrier Squelch Repeater. Being the only user in South Florida on 462.525, it was fine. Except a couple nights a year when we would get ducting from Orlando. "Monorail Black to the mainbeam". Yes, the monorails were on Class A CB and were hitting our repeater input this far south. I'm sure they moved to 800 MHz years ago, but once upon a time, Disney was a business on GMRS. If they renewed and didn't try to modify, they might even be active today.

12641. Tampa Area repeater

Yahoo group: GMRS (2005 — 2007)
Date: 2007-06-11 18:30:36 UTC
From: Danny Harmon
Topic: 12641 Message: 12641

I have found a repeater in Tampa on 462.700MHz. I have even found it's PL Code and successfully keyed it up. But I have never heard anyone actually use the repeater and can't seem to raise the owner to ask his permission to use it. One of those systhesized voice gadgets welcomes you when you first light it up and broadcasts the time on the hour... though it's two minutes slow.
Anyone out there have any knowledge of this station?

Thanks,
Danny Harmon

Try the TampabayGMRS Yahoo Group. The owners name is John. I am not sure if he is a member of this group or not.

Dan - if the repeater is properly configured it should broadcast its station call sign along with the time data. From their you can use the FCC USL to chase down the owner.

What do you mean by 'type acceptable'?

The TK-3140 is type accepted for Part 90 and Part 95, FCC ID# is
ALH32263130

IMHO you should give a new user at least 10, 20 or 30 days to produce a
GMRS call sign on your site. IMHO You should not require an valid FCC
license just to join your site. I might agree with after 30 days. But
not right off the bat.

Hi Bill,

I know of many models that will do what you want. But instead of listing them all, I'll ask instead of the price range that you're willing to spend for a repeater system (TX, RX, Duplexer included -- Ant. excluded).

12651. Programming Features of Icom F221

Yahoo group: GMRS (2005 — 2007)
Date: 2007-06-20 21:59:59 UTC
From: Chris Catotti
Topic: 12651 Message: 12651

I recently purchased three Icom F221 for GMRS and Amateur 440 MHz use. I will put one in each car and a base unit at home.

I have not started programming them yet. Can anyone who uses these suggest how they have theirs programmed? There are 8 banks of 16 channels. It has 5, 10 and 45 watt RF power levels. It also has Programmable Wide/Narrow Channel Spacing for Each Channel (am I required to use wide or narrow on GMRS or Ham 440?).

Topic: 12651 Message: 12653

Hi Chris, I have a pair set up for mobile and base use as well. I developed a sequencing schedme that I have across all my radios.You can arrange the banks into one group of channels or asign the banks as you like.

First of all, I have the shared FRS/GMRS channels in 1-7 at 5 watts (Labeled FRS1, FRS2 ect)

I then labeled each of the Channels accoring to the GMRS Primary repeater frequencies channel #'s with 4 channels in each; (GMRS 1, GMRS 1-1, GMRS 1-2, GMRS 1-3, GMRS 2, GMRS 2-1, GMRS 2-2, GMRS 2-3 ect)

GMRS x is open/no carrier (simplex)
GMRS x-1 is pl 100.0 (repeater)
GMRS x-2 is pl 141.3 (repeater)
GMRS x-3 is Pl 131.8 (repeater)

I picked this scheme as most of the repeaters in the areas I travel are on these tones. I programmed the p3 button as talk around with the pl's in tact. That way if I am traveling in two cars and lose the repeater we can simply push the p3 button to talk.

I have p1 as scan p2 is monitor . I left the factory settings on P0.

just my two cents.

I have three of them. I like them for some things such as the compact size. However I don't like the feel of the PTT button. I find it hard to tell if I have my finger on it correctly and whether I have keyed the radio up. I brought them to use in place of my TK-390 but have since gone back to the 390 for most situations. I keep a 3140 in my vehicle for when I want a small package while still having a radio with me.

No, I don't think so. Why? The local ARC is going to hold its "Field Day" at the county EMA building, again. While the A/C is nice, the public is restricted from entering and viewing all the action. This, I think is contrary to the spirit of Ham Radio's annual "Field Day", and I won't support it. I may stop by the local college's Field Day, and get familiar with their operations because it is actually outside, AND advertised to the public.

Its an extra 100 points if you operate from an EOC. Access to most anyone's
EOC is always restricted. Not the ham's fault.
We are operating from our back up EOC at Brazosport College.

12661. Field Day

Yahoo group: GMRS (2005 — 2007)
Date: 2007-06-22 23:57:43 UTC
From: Ray_Vaughan_99
Topic: 12661 Message: 12661

From the moderator...

I know many of us are hams but this is a GMRS list.

But, as long as you brought it up... I wish we could get the ARRL to issue points for Interop. That IS the big buzz word now in emergency communications and the FCC.

Show that we can, within all rules and regulations, communicate with public safety departments as well as the public. How?

Get at least a few hams to get licensed in GMRS.
Get ALL hams to buy an FRS radio.
Develop Memos of Understanding with local Police, Fire and Emergency Management departments to allow hams to carry THEIR radios on a day-to-day basis.
Establish a comms check with the USGC if allowed by the location (e.g. Field Day on a boat).
Make damn good and sure no one is walking around with a radio on PS frequencies that the licenesee doesn't know about.
Have pilot bring an aviation radio to do a comm check with airborne unit to simulate a landing zone comm.
Set up a long range cellular installation. Legal phone connected to a yagi to show that you can access distant cell sites.
Set up an analog ATV transmitter to show how the public can see us on a normal TV in CATV mode.
Comm with the American Red Cross on their Low Band channel.
Encorage the local agencies, like CERT, to set up booth and do demos at the Field Day location to show that we are working together.

I'm not suggesting that we CONTEST on these other radio services. Just give us a few points for proving that we can legally and technically Interop with others.

Think of the thrill a young kid would get if the guy talking to another state on one radio was talking to him on the radio he got for Christmas. FRS is a great intro to 2-way radio.

Okay... let's try to get back to GMRS. If you have a suggestion to improve GMRS using field day, let's hear it. Otherwise, let's get back to GMRS.

12662. Complete Kenwood Repeater System For Sale

Hi Group; Some of the members have been looking for a complete (Plug and play) repeater, so here is the deal of the year! I have a Kenwood TKR-820 (UHF) Rack Mount Programmable Repeater with a TPL Rack Mount 100 Watts Amp. (turned down to 50)a DuraCom Rack Mount Power Supply and a TX RX Rack Mount Duplexer (the "BEST) All of the equipment is mounted in a GE Mastr II Cabinet with Locking Dooors. The Repeater is on 462.725. If you need it on another GMRS pair I can Reprogram and retune at no charge. I am asking $1200.00 If you are interested I can send you photos. I wanted to offer to members before I post it on E-Bay. Let me know! I can be reached at (440) 336-1619 and I am in Cleveland, Ohio if you want to pick it up. I can also be reached at radios4bill@... Thanks, Bill

Sarge,
You and I have had happy dealings before. Please forgive me if I disagree with you about the "Field Day" site. One of the main purposes of Field Day is to let the public actually SEE what we do, and vicariously join in the excitement. The general public and the media seldom has a chance to actually see what we do, and to see what we can do when the communications infrastructure falls apart during natural disasters. If I ran the local club's field day ops, I would either run two different sites, or eliminate ops in an EOC/EMA and conduct the ops outside, foregoing the 100 points. A couple of good operators could easily make up the lost points in a short time.
I would also make a point to invite the TV and Radio media to our event. After all, the contest is not as important as the public exposure, and drawing more new people into the "hobby". Under the new licensing structure, it is very easy to add new hams to our ranks - and that is exactly what Field Day's purpose really is: to draw them in and get them to join. Best Regards!

TNX FM FRED - W4FJF/NNN0QAA REGION FOUR, 73

Well, what would be another name for a NationalSOS drill? GMRS Field Day?

If you are a GMRS licensee with or without a repeater, help your local REACT team or CERT organization run a NationalSOS drill.

Read it here. http://www.nationalsos.com/

GMRS is the bridge from FRS to Amateur AND can be a tactical frequency during an emergency.

Our local REACT team uses my GMRS repeater which is on a tower owned by the local HAM repeater club. There are two HTs in the EOC with the repeater freq and PL programmed in that a licensed GMRS operator in the EOC could use. As the GMRS repeater easily covers several municple areas, GMRS operators could be deployed to each EOC and relay reports into the amateur station in our town EOC. GMRS operators in neighborhoods could relay information directly to the EOC. FRS users could be giving info the the GMRS operators in their neighborhoods.

We all know this is the system of last resort. If you have an emergecny, dial 911. Use a land line or cell phone. But if the infrastructure is down, maybe even repeaters, the simplex radio comms will remain.

Just a thought.

Subject: [GMRS] Field Day

From the moderator...

I know many of us are hams but this is a GMRS list.

But, as long as you brought it up... I wish we could get the ARRL to issue points for Interop. That IS the big buzz word now in emergency communications and the FCC.

Show that we can, within all rules and regulations, communicate with public safety departments as well as the public. How?

Get at least a few hams to get licensed in GMRS.
Get ALL hams to buy an FRS radio.
Develop Memos of Understanding with local Police, Fire and Emergency Management departments to allow hams to carry THEIR radios on a day-to-day basis.
Establish a comms check with the USGC if allowed by the location (e.g. Field Day on a boat).
Make damn good and sure no one is walking around with a radio on PS frequencies that the licenesee doesn't know about.
Have pilot bring an aviation radio to do a comm check with airborne unit to simulate a landing zone comm.
Set up a long range cellular installation. Legal phone connected to a yagi to show that you can access distant cell sites.
Set up an analog ATV transmitter to show how the public can see us on a normal TV in CATV mode.
Comm with the American Red Cross on their Low Band channel.
Encorage the local agencies, like CERT, to set up booth and do demos at the Field Day location to show that we are working together.

I'm not suggesting that we CONTEST on these other radio services. Just give us a few points for proving that we can legally and technically Interop with others.

Think of the thrill a young kid would get if the guy talking to another state on one radio was talking to him on the radio he got for Christmas. FRS is a great intro to 2-way radio.

Okay... let's try to get back to GMRS. If you have a suggestion to improve GMRS using field day, let's hear it. Otherwise, let's get back to GMRS.

Fred,
Normally we do a park or something. However, it was supposed to storm here
and so at the last minute we threw together this plan. Only had a few people
anyway and with the extra points as incentive we made that decision.
Like I said most times its in a public park and everyone including
politicians are invited.

12666. Field Day Wrap Up

Yahoo group: GMRS (2005 — 2007)
Date: 2007-06-28 23:06:25 UTC
From: Ray_Vaughan_99
Topic: 12666 Message: 12666

Now that the ARRL Ham Radio Field Day is behind us, did any GMRS-only or FRS-only people make a contact with a ham station during the event? I know it wasn't for points, but it could have been a cool way to show interop.

Ray, KD4BBM

12667. Recording?

Yahoo group: GMRS (2005 — 2007)
Date: 2007-06-28 23:44:25 UTC
From: Ray_Vaughan_99
Topic: 12667 Message: 12667

Does anyone here record the transmissions on their GMRS repeater? Of course, it's not required, but I thought it might be interesting to see if anyone does it. If so, how do you do it?

I have recorded a few of my repeaters, but not GMRS yet. To do it, I use this software: http://www.zillenbiller.de/aircheck/

I've even set it up to make the recorded files available for download on my website within 5 minutes.

Some of you may be asking, Why?
It creates a record that can help you, as the licensee later. Assuming it's not you that screwed up, you can submit the recording as proof that it was someone else.
It lets you hear what happens on your repeater when you're sleeping or at work (or both).
It also seems to discourage illegal transmissions once everyone knows they're being recorded. Having it online proves you're not kidding.
It's also interesting to listen to old conversations. After a while you have a nice archive of what people have used your system.
If you do Public Service events, it provides a record of life/death communications for use later. One of the recordings done during a bicyle run covered our response to a fatal accident. It was used later for the investigation and training. It's still hard to listen to.

Ray

12668. Is an Auto Patch allowed on GMRS?

Is an Auto Patch allowed on GMRS? I was thinking of adding a CES 4700VP to a simplex control station in Upstate NY because there is no cell coverage.

No, sorry. Here's the rule that covers that:

[Code of Federal Regulations]
[Title 47, Volume 5, Parts 80 to End]
[Revised as of October 1, 2000]
From the U.S. Government Printing Office via GPO Access
[CITE: 47CFR95.141]

[Page 523]

TITLE 47--TELECOMMUNICATION

COMMISSION (CONTINUED)

PART 95--PERSONAL RADIO SERVICES--Table of Contents

Subpart A--General Mobile Radio Service (GMRS)

Sec. 95.141 Interconnection prohibited.

No station in a GMRS system may be interconnected to the public switched telephone network except as and in accordance with the requirements and restrictions applied to a wireline control link (see Sec. 95.127).

NO.

The regs prohibit interconnect to the PSTN (Public Switched Telephone Network).
Cite: 47CFR95.141 Interconnect Prohibited

The reg was written before the advent of the 'internet', so some folks have interpreted the reg to mean that non-dial line connection (i.e.; DSL, Cable Modem, etc.) is allowed.

I believe the intent of the ban was to protect the telephone company's turf (read: revenue).

I do not know if the FCC has ever definitively ruled on the issue of inter-connection via non-dial up lines like DSL, CableModem, or even BPL. You can see that technology marches on faster than the FCC attorneys can write regulations!

However, a connection via autopatch, which by definition is where the radio user can dial a phone number, certainly falls into the PSTN realm. As to VoIP services like Vonage or Skype -- I'm not sure. As far as I know, the 'dingotel' device is still being sold (it connects via VoIP to internet via a broadband connection - and not through a 'dial-up line').. so just maybe that's a form of tacit approval by the FCC - or just that this has not yet been ruled on. The real question may come down to whether a DSL line is or is not a 'dialup' PSTN connection. Circa 1995 - "What's the real meaning of 'is' ?"

Does anyone want to be the 'test case' before the FCC? it's a roll of the dice that you will either blaze a new trail -or- face a still fine.. any volunteers ? Anyone ?

A lot of folks read the regs just up to the point where they find the answer they wanted to hear - or at least they think it's the answer they wanted to hear!
=====

Good afternoon Steamer!

You will need to go to the following URL. FCC "Universal Licensing System", from which you can pull up your GMRS license. If you haven't registered previously, you will need to do so now!

But it won't let you 'renew' until a very short period before
expiration [90 days?].

Topic: 12675 Message: 12680

At this time, the FCC is only issuing individual GMRS licenses.

The only exception I've seen of late has been for a Police Explorer post - but they were then limited to just 2 assigned frequencies- sot of like to older business GMRS licenses.. (this is tough for the Post to enforce when the members start buying their own 22 channel radios).

For GMRS, you would probably have to get each individual their own license ($80 for 5 years). This can get expensive if the group is large. The only savings that might be available are for the immediate family of an individual licensee - those immediate family members can operate on the one license.. see the GMRS rules for the exact relations (it excludes cousins, nieces, and nephews from the definition of 'immediate family').

For a church group, you might be better off with a business band license (either UHF or VHF). Another possibility, if the users will be within a mile or 2 of the group during usage, would be the license free MURS (VHF 2W max) band. This would generally work well in outdoor settings such as outings, picnics, bazaars, etc. For indoor use (building penetration), UHF freqs would, or course, be better.

If you want real privacy, then the 900MHZ ISM band now has some 1W HTs - digital, spread spectrum, frequency hopping 0- for about $50 per radio that do provide effective privacy (unlike the very non-private use of GMRS, FRS, or MURS).

John,

I'm thinking GMRS, this is for our church group. I have a friend
who lives high on a hill, so I think I've got a location for it...
So our group can communicate when we're at the park, church
functions, etc.

I'm in Tracy, CA... about 15 miles south of Stockton.

Thanks,

Ben

12682. FS: Kenwood TK-3101 Radios (QTY=2)

Yahoo group: GMRS (2005 — 2007)
Date: 2007-07-13 21:13:48 UTC
From: n1nte
Topic: 12682 Message: 12682

Hi all,

I have two Kenwood TK-3101 2W, 15 channel UHF portables for sale. These are used but in good operating condition and look good cosmetically. They have some professional engraving on the front by the previous owner but a black Lexan sticker covers it.

Radios come with drop in charger, brand new 8" antenna (stubby antenna can be substituted, if desired), belt clip and used battery.

Price is $89 each plus $9.50 shipping. I accept PayPal and postal money orders. I can custom program to your specifications for no additional charge. I can also substitute a brand new high capacity (1700 mAh) battery for an additional $20 per radio.

Please email me directly if interested.

Thanks!

- Rob

PS - I've got some other Kenwood TK3100 2W, 2 channel UHF portables for $49 ($69 with new battery). Please email me directly if interested.

On the Kenwood TK3100 2W, 2 channel UHF portables what is the
condition and look's Thanks

12685. Re: R-100 repeater

Yahoo group: GMRS (2005 — 2007)
Date: 2007-07-15 09:15:25 UTC
From: Ben Totanes
Topic: 12675 Message: 12685

I know I mentioned church group, but it's really the families within that church group. We're not seeking to license the group, we're getting licenses for each family. So, I'm setting up the repeater so those families can communicate during their own private family activities or during a church-sponsored event.

Thanks,

Ben

12686. GMRS Repeater for Sale

Yahoo group: GMRS (2005 — 2007)
Date: 2007-07-14 05:45:57 UTC
From: Lake Hodges Radio
Topic: 12390 Message: 12686

If anyone is looking for a GMRS repeater on 462.575, please send me an email and I will send you details on one we have for sale.

(It can be easily programmed for other GMRS repeater pairs.)

12687. Re: R-100 repeater

Yahoo group: GMRS (2005 — 2007)
Date: 2007-07-14 17:53:38 UTC
From: Ben Totanes
Topic: 12675 Message: 12687

John,

I'm still interested in the repeater. If I cannot use this for GMRS applications, I will tune it for the 430MHz-450MHz ham band. I am licensed (K6BST), though have been off-air for several years, I have taken my radios from storage and have set up my antennas again. I've hooked up with other HAMs in the area and we're also thinking of setting up a coordinated repeater in Tracy.

As for our church group, we'll have to think of something else. Maybe stick with simplex for now. I don't think we'll have a problem with the cost of GMRS licensing.

Thanks!

Ben

12688. Chinese-made HT's?

Yahoo group: GMRS (2005 — 2007)
Date: 2007-07-17 22:11:17 UTC
From: Ben Totanes
Topic: 12688 Message: 12688

Has anyone tried any of these Chinese-made UHF radios at ebay? They're very inexpensive and has features comparable to more expensive HT's like duplex/repeater mode. Just wondering if there's any experience with these radios in this group... or are these even illegal to use in GMRS?

Thanks!

Ben

In the past, these were not FCC certified, so illegal for use in the USA.
Ask the seller for a FCC number and see if you get one.
Then check it out at the FCC database.
https://gullfoss2.fcc.gov/oetcf/eas/reports/GenericSearch.cfm

These guys usually sell the radios until they get a nasty-gram from the
FCC warning them not to sell them anymore.

Ben,

You get what you pay for !

1- Usually a cheaply made radio - a knock off of another design.
2- Usually no FCC approval.
3- Sometime expensive very shipping from Hong Kong.
4- Sometimes they are held up at US customs for you to pay the import duties.
5- Sometimes they are even confiscated by US customs because of #2 above. Then you are out the money AND the radio.

The fine print in the eBay posting may say it all about customs duties and YOUR responsibility..

Hello Ben,

I have not used one, but had a visit with a REACT team that
uses them. Illegal? You bet, I pulled the battery cover and NO
FCC Type acceptance. Does the team like them? YOU BET!

They are cheap, light weight (compared to some of the Moto
bricks they have) and field programable (that's why the FCC
won't type accept them, field progamable over the whole band
for TX/RX). The team I visited with works with local law enforcement
and field programs their units to talk on police freqs when they
need to with permission (what ever differnece that makes).

The other problem is if you ever want to fix one have fun just to get the info. And some you can not get replacement batteries for them.

Right now we have a sale on the Kenwood T3200U2 2 channels radio's at $180.00 each and Kenwood will be there when needed.

Ben - Be very careful with what you buy on eBay and similar sources. This includes some CB outlets and equipment offered at flea markets and other "tailgate" sales.

Every piece of electric components imports, manufactured in the US for resale and/or use in the USA must be "type tested" and certified to meet FCC requirements. "Type testing" is a very expensive, intensive and sometimes destructive set of test performed by a third party FCC certified engineering test laboratory.

If the piece of equipment as passed and been accept by the FCC you will find the FCC Type Approval on the piece of equipment. Usually it is on the back of the unit under the battery or battery cover. Note that approval made apart of the unit, will only be found on the unit and not on the cover or some-other part. For further information you can verify the FCC information found on the FCC data base found on there website.

I'm not saying all "bargains" and imports are illegal, however, you need to know what you are buying. If your buying from a stranger, you might inquire if the guy is a ham. No ham is going to jeopardize his ham license by using, selling or other wise conveying illegal equipment. In addition a ham is required to maintain his current address in the FCC data base which is public information. (Yes, I know there are some disreputable hams out there also, but they are few and far between!) I suggest you consult a knowledge able friend before making a purchase to tag a long or consult with you.

Actually, this particular one selling at ebay is already landed in the USA (Lake Forest, CA). So that means it has passed customs inspection (don't know if that means it's legal). Can anyone ignore $69 + $16.95 shipping? Well, it's still $85.95 but easily $100 less than a brand name with similar features. I'm thinking maybe I'll take the risk and see.

Anyone interested, check here:

http://cgi.ebay.com/NEW-Programmable-UHF-Digital-Portable-Radio-Walkie_W0QQitemZ170131464227QQihZ007QQcategoryZ4674QQtcZphotoQQcmdZViewItem

Also I found this deal on Motorola T7200's (these are the blister-packed units that has duplex/repeater splits, PL/CTCSS). $109.98 for a **pair**. This item has been discontinued by Motorola so this maybe the last few remaining sites offering these.

http://www.dakmart.com/itemdetails/29573/122/

Anyway... thank you for all the response!

> GMRS?

As others have said, the radios are inexpensive because they're 'cheaply made', first off. Then you run into the near certainty that they are not FCC type accepted, which you can determine simply from the fact that they tell you they can have the frequency easily programmed from the keyboard. The FCC frowns on that feature for part 90/95 radios. So far, I've seen only one of the cheap chinese radios that had an FCC approval, and it was for VHF High Band, not UHF.

Next, the seller's 'honesty' is quickly determined... the UHF Radio he's selling is pictured by a VHF HIGH BAND radio, not the radio he's selling! Give you a clue as to his dependability?

Unless it's type accepted, it can't be legally used on anything but (probably) UHF Ham frequencies. Even that may be arguable due to lack of Part 15 certification of the receiver!

12699. 450-470 Antenna for sale/trade

Yahoo group: GMRS (2005 — 2007)
Date: 2007-07-21 02:16:07 UTC
From: Noel Spears
Topic: 12699 Message: 12699

I bought at a recent Hamfest, an antenna described by the seller as a 440 amateur band antenna. It has a type â□□Nâ□□ connector on the bottom. The connector had a short length of cable attached, which was discarded. The connector is in great shape. After checking the antenna on a club antenna analyzer, it was determined to be usable in the range of 450 MHz to 470 MHz. After consulting with people that are more knowledgeable, and after checking the web, this antenna appears to be a Stationmaster II Omni Fiberglass model PD201-7. It may be an earlier model. Since the ID tag is missing, it is impossible to determine the exact make or model.

Pictures are available. I will cheerfully send them to whoever sends me an email at Rascal132 at Bigfoot dot com, or my ARRL.net email address. I will cheerfully sell this antenna, or trade it for an equivalent value 440 amateur band antenna.

I found some more info on those cheap radios and found out that some
of them are made with Motorola and Kenwood parts as most of there
parts are made there anyway. The Linton and KYD look like a MOT
GP338 radio. BUT you can't use on GMRS!! like those GMRS/FRS hybrids
radios people without a license.(pun) Here are some links on what I
found.

hi, all

my name is Tom I live in Santa clarita Calif. I just filed application for GMRS LICENSE online fcc web page today.

I was wondering about the type of radio I can use with my license I own one kenwood tk-380 HT & one kenwood tk-880 mobile. can i use these type of radio for GMRS ?

does anyone know if they is any repeaters in my area that I can listen to. on my radio.

thanks

Tom

Just to point out... GMRS is not, in general, commonly used for random chit chat between users who don't know each other or have some kind of organization or group, at least on repeaters. Not to say there aren't 'open use' repeaters, but they're rather rare.

The most common repeaters tend to be run by the REACT organization, on 462.675. There are several in the LA area of those. Some allow 'casual' users, some don't. It's up to the decision of the repeater owner.

I'm fairly sure I've heard of other (non REACT) repeaters operating in the LA area, but I can't offhand come up with one, there really aren't much in the way of true 'registries' of GMRS repeaters, since most of them don't want 'casual, drive by' users, it seems. You have to listen for a while, see what's going on, and then get in contact with the folks you hear.

Tom, you are welcomed to join us on the Verdugo Repeater (462.700). All you have to do is shoot the repeater owner an email so that he can make sure your gmrs license is valid. He will also add you to the authorized users list. The Verdugo machine sits atop of Glendale and covers pretty much all of Los Angeles County. In fact, we have a member who lives out in Santa Clarita.

As far as chit chat, that's all we do pretty much all day. We like to have fun but also get down to business when we need to. Most of the users on the Verdugo machine have some sort of affiliations to public safety agencies and most are CERT trained. LA County React is also run off of that repeater.

Subject: Micor repeater

Got a Micor repeater 8 to 10 watts with a Zetron 38A tone panel installed. 462.700 /467.700 for sale. Was working when removed from service 7/1/07 . Repeater does not have cabinet with it. Just power supply, repeater cage and Zetron 38A. Will sell complete as is for $295.00 and this covers shipping to the 48 states only.

thanks John

If you do not want the 462.700 / 467.700 elements others available 461.XXX and 464.XXX

GMRS is not the place for that. Ham Radio is the place to be if you have an interest in communication and making new friends. With Morse Code no longer a requirement, it's easy to study for a license and talk around the world. Sun spot cycle is on the upswing.

Goto www.arrl.org for more info.

I think it would be better to say Amateur radio is BETTER place to chat. But by all means, chat on GMRS if that's what you want to do. As long as it's legal, you can feel free to use GMRS as you wish. Just be courteous of others on the channel. Leave gaps in your conversation to allow others to join, or to use their systems.

I totally agree with the others.
Why can't GMRS be an alternative to Amateur at times? It is considered partly a family communication service, isn't it? The radio community is a big family.

GMRS can be used to chat with other licensees, yes. In some places, it is, quite a lot. In others, not. Let's look at the FCC definition of the purpose of GMRS:

Sec. 95.1 The General Mobile Radio Service (GMRS).

(a) The GMRS is a land mobile radio service available to persons for short-distance two-way communications to facilitate the activities of licensees and their immediate family members. Each licensee manages a system consisting of one or more stations.

Looks like the primary intent is communications within/for family activities, doesn't it? Not restricted to that, or they'd have kept the older rules that prohibited talking to other licensees, but the intent is for local (notice that short distance?) family type communications. Certainly local chat with friends comes under the heading of 'activities' of the licensee, but it's not the primary function of the service.

Heck, most users of bubble packs (whether licensed or not) will tend, from what I've seen, to react badly to anyone trying to talk to them as 'interlopers' on 'their' radios. They're using the radios for the intended use, and don't want non-family/friends bugging them while they do.

Might remember that 'short distance' when proposing linked repeaters to cover huge areas, too...

12717. Setting up a community tone panel

Yahoo group: GMRS (2005 — 2007)
Date: 2007-08-08 23:23:28 UTC
From: Steve
Topic: 12717 Message: 12717

How would I go about setting up a community tone panel? What does it do exactly do. I need to set up 4 groups with 4 radios each for paintballing. I have a GR500 UHF repeater with a Zetron ZR310 community tone panel and we have 16 SP50 radios (4 of them with DTMF keypad) on GMRS. (All the families are licensed which makes it easyer to ID players). Can the groups talk at the same time of do I have to set it so the radios can only talk when the repeater is not busy. (A little confused on how it works).

Only one user at a time. With SP50's, I would program up
BCLO (Busy Channel Lock Out) or force monitor, (No recieve PL)
unless you can depend on your users to hit the monitor button
before they transmit.

Community tone panels are used in the commercial world
to allow different companies to use one repeater, normally
the repeater owner charging a per unit fee for use on a monthly
basis.

It will not allow people on different tones to use the repeater
at the same time. You must monitor before use, or have BCLO,
so that you will not double with a user already on the frequency.

Clear as mud?

From: ka1jfy
Topic: 12717 Message: 12719

The community repeater panel ADDS multiple tones to allow access to
the SINGLE frequency pair.
That means that only one person can talk on the repeater at a time.
It's a party line, with restricted access [only those transmitting
one of the allowed tones will make the repeater function]

I think what's confusing is the use of the terms 'privacy codes'
or 'private line codes'.
They mostly keep you from hearing other people, not from being heard.

Programming on the portables is up to you.
Busy channel lockout can prevent 'stepping on' someone elses
transmissions.
BUT, it means that the users have to wait for the repeater to drop
out [stop transmitting] before they can talk.
If you do this, set the repeater dropout delay to the smallest value
you can live with.

DTMF pads are not going to be of much use, BUT they may be able to
access the tone panel programming and mess with it.

What we really need to help you out is to know more specifically how
the radios are to be used.
Are there going to be 4 separate teams that shouldn't be hearing each
other because they're opponents? [A single repeater won't help here,
you'd need 4]
Or are they all going to be on the same side?

Walter, WPXP269

Have a Micor repeater less cabinet. (true repeater not mobile)
8 to 10 watts
462.700 TX 467.700 RX
Zetron tone panel Model 38A
with power supply

$295.00 and covers shipping in the 48 States only

working when removed from service July 3, 2007

thank you John

Will also sell a Motorola Duplixer tuned at this time 462.19 at this time $115.00 also covers shipping to the 48 states.
This is a full size unit that racks mounts in a Micor cabinet.

Even four repeaters won't provide real 'security', the teams will,
after they figure out the radios, simply slip in their own radios, on
scan, with no CTCSS, to monitor all the other teams.

No encryption allowed on GMRS, either.

The short answer is NO. GMRS repeaters are meant to be for local area communications. Linking of repeaters is forbidden. I'll let the ones that know better cite the particular paragraph in Part 95. I just thought I would answer this one quickly.

I've been in contact with AT&T Corporation -- Commercial & Business, and I have some information that will allow GMRS repeater owners to link their systems together via phone lines that are not connected to the PSTN and that is 100% Part 95 accepted.

It has taken me over a month to accomplish this goal by contacting AT&T Business, Corportate Headquarters, Customer Service, and Technical Support via phone and email. You would think that AT&T would know what services do and don't operate on a PSTN system... So it took a little patience and time, and I finally got some answers.

There are two options available. Both of which can be used either locally or for long distances.

Once I finish up the loose ends here (pricing, service requirements, etc), I'll make the information available to this and other GMRS groups and websites.

Although the GMRS' original intent is to communicate with families and individuals locally, I wanted to prove and disprove the theory and fact that linking a GMRS system can be done under Part 95 regulations. ... I now have information which shows that this type of service is fully supported under Part 95 using resources dating back from 1996 to present time.

**Clearly stated: If you have an issue regarding this subject, please contact me privately.

> I've been in contact with AT&T Corporation - Commercial & Business,

Hint: AT&T is in business to sell you the link, not to protect you from the consequences. They'll tell you whatever it takes to get you to buy.

The FCC rules for GMRS as a whole are, to put it bluntly, very badly written/hashed by changes over the years that broke things, left hanging rules that depended on other, removed rules, etc. There are two Part 95 'rules' that apply. One prohibits connection to the public switched system. Fine, you avoid that. BUT:

Sec. 95.183 Prohibited communications.

(12) Messages which are both conveyed by a wireline control link and transmitted by a GMRS station;

Doesn't say anything about the public switched system, does it? Just 'wireline'.

If you actually want to cover yourself, you'd best contact the FCC in Washington and ask specifically if your proposed idea is acceptable. The FCC can ALWAYS cite you, if the tech rules above don't fit, they'll cite you for violation of the 'purpose of service' rule.

Sec. 95.1 The General Mobile Radio Service (GMRS).

(a) The GMRS is a land mobile radio service available to persons for short-distance two-way communications to facilitate the activities of licensees and their immediate family members. Each licensee manages a system consisting of one or more stations.

That 'short distance' is all the FCC needs to shut down any linking scheme, if they dislike it.

12732. Re: [GMRS] Re:repeater linking

Yahoo group: GMRS (2005 — 2007)
Date: 2007-09-05 17:36:31 UTC
From: Shane Young
Topic: 3754 Message: 12732

You'll note that of the aproximately half a dozen replies, nobody quoted the specific regulation prohibiting this (or permitting this).

The reason is that it is particularly vague. The rule that most people think apply to this would prohibit "interconnection to the public switched telephone network"

Sec. 95.141 Interconnection prohibited.
No station in a GMRS system may be interconnected to the public switched telephone network except as and in accordance with the requirements and restrictions applied to a wireline control link (see Sec. 95.127).

Well, 95.127 doesn't seem to exist anymore.

My issue, is that Interconnection is not defined in the GMRS ruels (that I have seen), unlike the MURS rules:
http://wireless.fcc.gov/services/index.htm?job=operations&id=multi_use

Which say:
MURS stations are prohibited from interconnection with the public switched network. Interconnection Defined. Connection through automatic or manual means of multi-use radio stations with the facilities of the public switched telephone network to permit the transmission of messages or signals between points in the wireline or radio network of a public telephone company and persons served by multi-use radio stations. Wireline or radio circuits or links furnished by common carriers, which are used by licensees or other authorized persons for transmitter control (including dial-up transmitter control circuits) or as an integral part of an authorized, private, internal system of communication or as an integral part of dispatch point circuits in a multi-use radio station are not considered to be interconnection for purposes of this subpart.

(Note that more recent rules defining interconnection to the PSTN in regards to VOIP providers get into more details about being able to place and receive calls from the PSTN. I suspect that has been given much more thought than the GMRS rules.)

So, this is the path that Ryan is probably going down.. Finding a "wireline circuit or link furnished by common carriers" such as AT&T.

There is another rule which could use clarification:

Sec. 95.183 Prohibited communications.
(a) A station operator must not communicate:
(12) Messages which are both conveyed by a wireline control link

and transmitted by a GMRS station

This could mean that if you have a wireline control link you can not use it to transmit over GMRS. It could also mean that if you have multiple stations on the link (such as paralelled remote base consoles) you can not communicate a message which can be heard on both the paralelled stations and on the GMRS channel.

Many times we talk about "the letter of the law" and "the intention of the law". My opinion is the interconnection rule is to prevent pepople from having 50 watt cordless phones. There are just not enough channels for eveyone to do that. I've heard others say that it was to prevent "damage" to the PSTN. Because it's not clearly stated, it could be anyones guess.

My opinion (for what it's worth) on linking is that I could see practial uses for it, but I wouldn't want to see some nation wide "linking a bunch of repeaters together for chit chatting". That seems more like a ham thing.

Having my repeater in Northern Minnesota connected to my repeater in Southern Minnesota so I can keep in contact with my family in both areas seems like a more "contained" link.

There is another agrument about channel sharing. Not being able to monitor the far end of a link before transmitting. This is a potential concern, but the problem exists today with a stand-alone repeater. If I'm 10 miles away from the repeater, I'm not going to hear somone who is 5 miles in the other direction talking on the output. That scenerio exists today.

We can all be arm-chair lawyers, but about the only thing you could safely say is the rules are vague (possibly intentionally) and the FCC could proably apply them as they see fit.

But wireline is not the only method of linking repeaters, and the above is
(Like most of the GMRS rules) ambigious.

```

Chuckle. Yes, you can contact the FCC. One of a few things may
happen - one, you get someone who actually can give you an answer,
that is correct and factual. Two, you get someone who gives you an
answer, that is restrictive, yet covers their butt. Three, you get someone
who gives you the answer you want to hear, but not the answer that the
next 5 people would give you when calling the FCC.

Define short distance. Define linking. I have seen RF links for as short a distance as 6 inches.

The short answer:
The advice to have a definitive ruling for YOUR implementation is best advice I've seen on this topic! It is the only real protection that you will not be bitten later by another FCC enforcement attorney's personal reading of the regs.

And the (very) long story.....

It's not uncommon to find govt regs that conflict with each other and/or seem to be at cross purpose.
laws and regs are written by lawyers for lawyers - It's jokingly called the AFEGA (the "Attorney's Full Employment Guarantee Act")
This is not limited to the FCC. The same sort of conflicts and contradictions can be found in the rules and regs from almost all federal and state agencies.

Think of the federal initiative to spur the use of ethanol in auto fuel. It requires the growing of tremendous amounts of grains to ferment into alcohol (ethanol). So what does the govt do? ... Why they continue to subsidize many farmers NOT to grow some of the needed crops. This of course limits supply while increasing demand - therefore raising prices.

So in an attempt to 'protect' farmers against low crop prices brought about by larger supplies, the subsidies reduce supply to and therefore increase the price. This seemingly creates a disincentive to use ethanol - an exact financial cross purpose of the ethanol initiative ! The govt them mandates, by law, the use of ethanol, further increasing demand which increases prices. Doing this thwarts the normal functions of supply and demand as we now have NO choice but to buy the now more expensive ethanol laden fuel !

Go figure !

There are numerous examples like this sprinkled around all the federal agencies.

Two FCC attorneys, just like two local DAs looking at a criminal statute, can and do interpret the same regs differently. Any two judges can also occasionally rule in opposite fashion about the very same wording.

Courts do override each other in seemingly nutty fashion (look up the "Dred Scott" case of the 1800s for one of the most egregious examples) from time to time.

You just cannot stop at the rule that tells you what YOU want to hear !

The original rules (for many services) in regard to "linking via the PSTN" were lobbied in by the telephone company (the giant Ma-Bell - AT&T - at the time) for one primary reason: To protect their revenue stream !
At the time, AT&T had a virtual monopoly, franchised by the govt, over interstate telephone service in most of the US. Their concern was that evolving technology would supplant some, if not most, of the revenue guaranteed by their franchise. Like any franchise, the grantee gets rights and protection AND has some obligations to the grantor (the govt). The primary obligation was to provide phone service to almost everyone at rates that were controlled by federal and state agencies.

The advice to have a definitive ruling for YOUR implementation is best advice I've seen on this topic! It is the only real protection that you will not be bitten later by another FCC enforcement attorney's personal reading of the regs. ALL agencies can interpret the same rules in sometimes inconsistent fashion. A precedent of one interpretation sometimes helps - but not always ! Even judges sometimes override precedents in their reading - mostly claiming that the cite for precedent was not an exact fit.

The moral story is that our form of democracy is the worst one in the world... except for all the other forms that are worse than ours... Go figure !

._._.

12736. Re: [GMRS] Re:repeater linking

Yahoo group: GMRS (2005 — 2007)
Date: 2007-09-05 20:36:15 UTC
From: rfd rfd
Topic: 3754 Message: 12736

But wouldn't a intercon., be so you can use a DTMF key-pad to make phone calls on?

Shane Young <yahoo1@...> wrote: You'll note that of the aproximately half a dozen replies, nobody
quoted the specific regulation prohibiting this (or permitting this).

The reason is that it is particularly vague. The rule that most
people think apply to this would prohibit "interconnection to the
public switched telephone network"

Sec. 95.141 Interconnection prohibited.
No station in a GMRS system may be interconnected to the public
switched telephone network except as and in accordance with the
requirements and restrictions applied to a wireline control link (see
Sec. 95.127).

Well, 95.127 doesn't seem to exist anymore.

My issue, is that Interconnection is not defined in the GMRS ruels
(that I have seen), unlike the MURS rules:
http://wireless.fcc.gov/services/index.htm?job=operations&id=multi_use

Which say:
MURS stations are prohibited from interconnection with the public
switched network. Interconnection Defined. Connection through
automatic or manual means of multi-use radio stations with the
facilities of the public switched telephone network to permit the
transmission of messages or signals between points in the wireline or
radio network of a public telephone company and persons served by
multi-use radio stations. Wireline or radio circuits or links
furnished by common carriers, which are used by licensees or other
authorized persons for transmitter control (including dial-up
transmitter control circuits) or as an integral part of an authorized,
private, internal system of communication or as an integral part of
dispatch point circuits in a multi-use radio station are not
considered to be interconnection for purposes of this subpart.

(Note that more recent rules defining interconnection to the PSTN in
regards to VOIP providers get into more details about being able to
place and receive calls from the PSTN. I suspect that has been given
much more thought than the GMRS rules.)

So, this is the path that Ryan is probably going down.. Finding a
"wireline circuit or link furnished by common carriers" such as AT&T.

There is another rule which could use clarification:

Sec. 95.183 Prohibited communications.
(a) A station operator must not communicate:
(12) Messages which are both conveyed by a wireline control link
and transmitted by a GMRS station

This could mean that if you have a wireline control link you can not use it to transmit over GMRS. It could also mean that if you have multiple stations on the link (such as paralelled remote base consoles) you can not communicate a message which can be heard on both the paralelled stations and on the GMRS channel.

Many times we talk about "the letter of the law" and "the intention of the law". My opinion is the interconnection rule is to prevent pepople from having 50 watt cordless phones. There are just not enough channels for eveyone to do that. I've heard others say that it was to prevent "damage" to the PSTN. Because it's not clearly stated, it could be anyones guess.

My opinion (for what it's worth) on linking is that I could see practial uses for it, but I wouldn't want to see some nation wide "linking a bunch of repeaters together for chit chatting". That seems more like a ham thing.

Having my repeater in Northern Minnesota connected to my repeater in Southern Minnesota so I can keep in contact with my family in both areas seems like a more "contained" link.

There is another agrument about channel sharing. Not being able to monitor the far end of a link before transmitting. This is a potential concern, but the problem exists today with a stand-alone repeater. If I'm 10 miles away from the repeater, I'm not going to hear somone who is 5 miles in the other direction talking on the output. That scenerio exists today.

We can all be arm-chair lawyers, but about the only thing you could safely say is the rules are vague (possibly intentionally) and the FCC could proably apply them as they see fit.

From: Shane Young
Topic: 3754 Message: 12737

It's not spelled out in the rules what this means. DTMF has little to do with it, but one way you could read that rule is "you can't hook your radio system up to the phone network to place or receive phone calls". The rules don't say that. They don't actually *define* interconnetion.

Interconnection means different things to different people.

Because none of the people here (including myself) who have replied are named "Hollingsworth" and work for the FCC, the best we can do is "guess" as to what's right and wrong.

If I were to "ask" the FCC, I'd present it as a system design:
Describe how the system would function.
List out all of the concerns that have been mentioned here and how you would address them.

I don't think you're gonna get an "it's ok to link repeaters" answer without some provisions.

A GMRS system cannot link via a wireline connection. But it can send the GMRS system audio data through a terminal that will connect to a wireline network, then back through another terminal that decodes that audio and sends on the output of the second repeater system. This type of connection will allow the repeater system to become separate from the wireline network.

Repeater systems also have controllers that allow you to enable when to open or close that link at any preset given time after that system has been inactive.

If the system is yours (you own it), and you know that the tone is not in use in the area, it will work. There are also devices that can monitor a particular frequency/tone and let the system know if it is busy or not.

I've met with various organizations and groups, and all have agreed that the proposition is on target. I will schedule time to contact several people within the FCC about this proposal, and let you know the outcome of this.

As I mentioned before, if you wish to discuss the details of my proposition, please contact me privately on the side.

Repeater linking is ILLEGAL on GMRS. However, the Bluecom GMRS system here in the Northeast (462.600) links their repeaters, some using UHF frequencies OUT OF THE GMRS SPECTRUM.

12744. Re: Setting up a community tone panel

Yahoo group: GMRS (2005 — 2007)

From: Richard Hayman
Topic: 12717 Message: 12744

Community tone panels are useful when different groups just want to hear from other members of their group. In other words, they really do not want to hear from anyone other than a member of their own group. This makes more sense when you use the word "business". What business wants to hear chatter of other businesses on a shared repeater? Another use was to control access and payment for repeater use. At any rate, most radios go to OPEN channel or monitor mode when the mic is removed from its holding clip. This monitoring requirement is so that one station does not transmit over another when the channel is in use.

There is no privacy on a shared repeater unless it has encryption or is trunking.

I have a GR500 and a tone panel. Get the right cables and installation is a snap.

From: Dave Word
Topic: 12745 Message: 12745

I'm new to the group, and to GMRS. I mainly joined for information on what (real) mobile and HT equipment people are using, before I start spending money. I've picked up quite a bit of information from reading old postings.

One thing I notice, though, is the disdain some group members seem to have toward cheap FRS radios. I love 'em for one reason. They're cheap and useful administrative (chatter) radios for EMCOMM groups who may be deployed within a reasonable distance of each other, and who need to keep their primary radios and net frequencies clear for served-agency traffic, but who still need to communicate among themselves.

You can easily pick up a dozen of them for less than a hundred bucks, and if some of them get broken or go missing during an event or drill, who cares; you just buy more.

I'm not here to defend Bluecom, but your statements are very strong.....can you back them up? How are they linking their GMRS system? What frequencies outside of the GMRS spectrum are being used?

Please list them as I would like to monitor this and see if this is indeed true. Bluecom pops up on several boards every now and then and I would like to know more about them.

Other GMRS operators and myself have monitored Bluecom using link frequencies OUT OF BAND in the Northeast region. I can also say without question that Bluecom DOES NOT USE GMRS 467.600 MHz as an input on their primary repeater system in NYC. They have several OUT OF GMRS BAND INPUT FREQUENCIES in the 457 & 459 MHz range.

12748. GMRS type-certification

Yahoo group: GMRS (2005 — 2007)
Date: 2007-09-13 00:29:43 UTC
From: Dave Word
Topic: 12748 Message: 12748

Does anybody know how to find out if a radio is GMRS certified? All the manufacturers seem to be pretty cagey about it; nobody seems to say on their web site. For instance, I was looking on the Icom site the other night and some of their model numbers seemed to imply that they were for GMRS, but they never specifically said so. Also, if you wanted to buy something from eBay, you might have a problem getting information from the manufacturers of discontinued models.

Can anybody give me any hints?

Thanks,
Dave, N4DYR/AAV4WX/WQHM574

Ask the seller to provide you with the FCC
authorization code and go to this page:

https://fjallfoss.fcc.gov/oetcf/eas/reports/GenericSearch.cfm

Try it with one of your pieces of ham gear to see how
it works. The return from the FCC site will show if
the gear is type certified, and for what FCC part. In
the case of GMRS, Part 90 gear is ok if the FCC grant
was before a certain date, the exact date of which I
am not certain. Part 95 covers GMRS.

Topic: 12748 Message: 12751

Sure Dave, it's easy.
Here is the website:
<https://fjallfoss.fcc.gov/oetcf/eas/reports/GenericSearch.cfm>

Enter the first three letters/numbers of the Type Code from the FCC tag on the radio in the box labeled Grantee Code. Then, list the remaining portion of the Type Code in the box labeled Product Code. Then hit "Start Search".

Then, click "Display Grant". The result will indicate the Part number of the FCC Rules (90, 95, 97, etc.) that the radio is acceptable for.

Hope this helps.

When down in the NYC area, I stumbled upon their input. I don't remember the exact frequency, but it was in the 457-9 range. I remember that they were on the edge of a band. Maybe the remote broadcast? Interesting enough, they had a small repeater that, upon hearing the output signal, would rebroadcast the signal on the input frequency, giving the appearance of a legitimate input signal. Since the repeater does not listen to 467.600, it causes no interference to them. The way I spotted this was that the "input" frequency started transmitting after the output signal.

For what ever reason, the FCC has decided to ignore them. This has been going on now for many years. (I was told over 5 years). It appears that if the FCC has chosen to ignore them, the FCC has, by default, endorsed out of band transmissions and repeater linking, given the long term of this behavior.

Not living in the NY area, I must rely upon more information regarding the illegal behavior of these pirates, from people afflicted with their presence.

Line of Sight Problem.
At 6 feet of elevation, the horizon is 3 miles away. If two people are looking at each other, the maximum distance between the two is six miles.

Use Radio Mobile software to predict coverage on UHF and VHF.

It uses DTED (Digital Terrain Elevation Database) files to plot the line of sight range for any area. You simply tell it the data about your antennas, height above the ground for each end of path and how much power you are running. It will plot a map for coverage from any location you desire. It takes into account the frequency of the transmitter/receiver as well and gives the expected field strength is microvolts if needed.

It does require some technical data that hobbyists dont have access to, but you can use it in 'visual' mode without entering any data except the transmitter location if desired.

It's free software although it shouldn't be.

The website is:

http://www.cplus.org/rmw/english1.html

There is also a yahoo email list for those needing support for advanced issues.

Regards,

Art

On September 23rd 2007 at 1pm, there will be an Community Emergency communications drill held in Staten Island, NY. This drill is being hosted by Port Richmond CERT under NationalSOS guildelines on FRS channel 1. (462.5625 mhtz)

Members of the community are invited to use their FRS radio's to attempt contact with CERT members stationed throughout the Island during the drill. The purpose of this drill is to educate the public on the uses of the FRS radio to communicate and solicit help when normal methods of communications fail (phone lines, cell phones, etc).

This drill is based on the NationalSOS project (www.nationalsos.com). The drill is expected to last about one our. Results of the drill will be posted on the Port Richmond CERT website and NationalSOS forums.

For more information, email us or visit our website/yahoo group at www.sicert.org

12760. Re: [GMRS] GMRS type-certification

Yahoo group: GMRS (2005 — 2007)
Date: 2007-09-13 15:22:01 UTC
From: Walters
Topic: 12748 Message: 12760

Hi Dave,

You really need the FCC registration number off the radio body. Its the only sure way to know. You can then look this up in the FCC equipment database. However, some units will also have the Type Acceptance along with the ID so you know already. But getting that from a seller is difficult if not impossible. All those Chinese radios that look so sweet with keypad frequency entry from 400-470MHz are NOT type accepted because the FCC just won't allow field programability like that in the Public Service bands.

This is the equipment lookup at the FCC.

https://fjallfoss.fcc.gov/oetcf/eas/reports/GenericSearch.cfm

What we as GMRS'ers really are waiting for is a HAM type radio with 100 or so memories, front panel setup of freq, repeater shift (+5 or none) and PL tone with an onboard processor that prevents TX on anything except a GMRS simplex or repeater input freq.
The ICOM F21GM is as close as I have seen, if it just had a keypad and memory to save specific setups. Right now you can manipulate everything but once you set a PL or repeater shift on a channel, that's it. You cannot "save" that setup anywhere and you have to go through the whole power on holding X, Y and Z buttions again to change it.

Subject: [GMRS] GMRS type-certification

Does anybody know how to find out if a radio is GMRS certified? All the manufacturers seem to be pretty cagey about it; nobody seems to say on their web site. For instance, I was looking on the Icom site the other night and some of their model numbers seemed to imply that they were for GMRS, but they never specifically said so. Also, if you wanted to buy something from eBay, you might have a problem getting information from the manufacturers of discontinued models.

Can anybody give me any hints?

Thanks,
Dave, N4DYR/AAV4WX/WQHM574

Stan - Although no longer available new, the Kenwood TK-370G portable is the GMRS users dream radio. Operates well outside of the specified bandwidth, 128 channels, an OST (operator selectable tone) menu that allows the user to bring up a handful of CTCSS tones, full-function DTMF pad and the sweet part is that it's Part 95 certified.

Have a Micor repeater less cabinet. (true repeater not mobile)
8 to 10 watts
462.700 TX 467.700 RX
Zetron tone panel Model 38A
with power supply

$295.00 and covers shipping in the 48 States only

working when removed from service July 3, 2007

thank you John

Will also sell a Motorola Duplixer tuned at this time 462.19 at this time $115.00 also covers shipping to the 48 states.
This is a full size unit that racks mounts in a Micor cabinet.

Hello everyone.

I'm new to GMRS just paid my 85 bux to FCC. i live in so-cal and needed some kind of SHTF comm's for the family. we live on a good sized hill and have about 40 miles of clear air
to the west of us. i want to have a base and 3 mobile units. if any one has favorite
equipment I wouldn't mind hearing about it.

I'm of the spend once, cry once, mind set. I don't like to buy cheap stuff and then need to replace it because I find something better in six months. I want good from the start.
that doesn't mean i want the most expensive i just like to have good quality.
like any one i want the best bang for the buck.

i was told by a local ham that midland and kenwood are ones to look at. is this right?

Hi Craig.

Welcome to the group.

Clear air is a relative term, especially on days when
I can't see Mt. Lee/Griffith Park
Observatory/Hollywood sign from the ridgeline in
Redondo Beach! Actually, on days like today, its the
coastal fog that gets in the way of visibility.

I've got a pair of bubble packs but am looking to
upgrade to Icom IC-21GMs for portables. Doing this as
my daughter does not go to a neighborhood school and
the cellphone networks are severely overloaded in the
southbay before stuff happens.

12772. Question about organized group use of GMRS

Yahoo group: GMRS (2005 — 2007)
Date: 2007-09-29 14:21:36 UTC
From: qualitylights
Topic: 12772 Message: 12772

Hello all.

I'm kind of a newbie to the hobbie (in it about 6 months or so) and I have a question. Now please, I am in NO WAY trying to start a flame war with this question. I just want some information that may benifit a local community watch group.

I called the FCC question hotline yesterday and was told that GMRS can not be used for organized activities, such as a community watch group, but I have noticed that REACT groups are a large user of the service. Is there a loophole that I am missing, or was the FCC rep that I spoke with not answering my question correctly?

Any help on this matter would be GREATLY appreciated as we are looking for a reliable, inexpensive method of communication for this group. I won a local repeater and would be more than happy to let them utilize it at night for their watch groups.

Thanks to all in advance for any information.

Chuck

Topic: 12772 Message: 12773

Chuck,

It all depends on how you asked the question.

If each member of the community watch group acquired an FCC GMRS license, then they would be just as legal of a user group as REACT.

However, there is no "group license" available for the group in the GMRS.

I'm sure Stan will be able to provide some insight from a REACT member's perspective.

Welcome to the inaccurate FCC 'help' system. Probably, they misunderstood you to be asking if the watch group could get a license as a group, which they cannot. Only 'grandfathered' non-individual licenses are allowed, from many years ago, and they're not allowed to change their authorized system in any way.

The Community Watch Group certainly CAN communicate via GMRS, but each individual member must be licensed (Families covered by a single license). Business of the group is allowed, as is personal business, etc. What's prohibited is communications for hire, that sort of thing, so you can't charge for group services. Repeater owners ARE allowed to require their users to contribute reasonably to upkeep of the repeater, though.

if you use the TK-3180 DTMF you could set your freg and do 40 PL tones on the number pad.

you and also do the 40 PL tones on the TK-8180

12776. Question about organized group use of GMRS

Yahoo group: GMRS (2005 — 2007)
Date: 2007-09-30 06:38:43 UTC
From: Lake Hodges Radio
Topic: 12772 Message: 12776

At 07:21 AM 9/29/2007, qualitylights wrote:
>I called the FCC question hotline yesterday and was told that GMRS

>that I spoke with not answering my question correctly?

I am not sure that you have this in the right context.

What the rep at the FCC probably meant was...

-- A community watch group CAN use GMRS channels 1-7 and 15 to 22, but every one who uses a radio must be licensed.

-- Immediate family members can share one family license... siblings, parents, grandparents, kids, spouses, aunts, uncles -- just about everyone except your cousins are covered by your license. The main licensee has to be 18 years of age or older and not a representative of a foreign government.

-- You can no longer get a Group GMRS license that can be used by a group of people who are not related. So, one license cannot be used by unrelated people in a neighborhood watch group or a REACT Team or a CERT Team. Everyone needs their own license on GMRS,

---

The solution for your neighborhood watch? Get a few people with GMRS licenses and each of them can use five watt radios on channels 1 - 7, which are dual use GMRS and FRS. Then get a bunch of 500mw FRS radios that also operate on channel 1 - 7. The people who are NOT licensed (or related to someone with a license) can use the 500mw radios and can legally talk to the licensed people with 5 watt radios. Set up a hub and spoke system with the GMRS licenses as the hubs and the FRS people as the spokes. All this is totally legal under part 95. http://www.provide.net/~prsg/part95ae.htm

Of course, about 20 million people have purchased the 1-watt combo GMRS / FRS radios and have disregarded the licensing requirement for channels 1-7 and 15-22. I am not saying that you should do that, I am just noting that this happens and the FCC does not ever seem to enforce the GMRS licensing rules.

Another solution is to have everyone use FRS channels 8 to 14. Those are license free FRS channels, as long as you operate with 500mw or less.

If you really want to get serious, have people take the Amateur Radio technician test and use Ham frequencies instead. They are much more functional and you can do a lot more. One of the 10-year olds in my neighborhood got his tech license recently. Any motivated adult can do it. Emergency comms are much more serious and useful on the Ham bands, especially on 2 meters and 70cm for local emergency comms. GMRS and FRS are marginally useful and very short range, unless you have legal access to a GMRS repeater. Even then the Ham bands are far more useful.

http://www.qrz.com/p/testing.pl

http://www.hello-radio.org/whatis.html

Some Ham groups use the Ham bands to communicate with each other over long distances, and then use FRS radios to talk with their unlicensed neighbors within a mile or two.

Good luck!

Once again, the FCC has NO CLUE about the rules THEY wrote.

You can use GMRS for basically anything, provided ALL users are licensed according to the rules, AND use the radios according to the rules. REACT groups personify this.

As a former REACT Team president and current GMRS user, it is my understanding that GMRS can be used for REACT, Crimewatch, etc. Just NOT for money making businesses. Also, it is my understanding that all users need to have a current GMRS license.

Hopefully that will shed some light on it for you. I am by no means an expert on this, but this is my experience with it.

qualitylights <qualitylights@...> wrote: Hello all.

I have an Icom F21 / 45 mobile
set up as a base station using
a 40 amp power supply. I have the
same radio also in my 2007 Chevy
Impala with a Maxrad 3 db base
loaded antenna.

I have an 9.8 db fiberglass base
anteena on the roof (aprox. 35'
at the tip.) I live around bldgs,
etc. and reach out 12-15 miles
base to mobile.

On my 4 watt Icom and Smartcom
portables, I talk aprox. 5-6 miles
to the base.

Icom is the best way to go if you want
a real good radio without paying alot
for the name.

12782. GMRS vs Ham Radio

Yahoo group: GMRS (2005 — 2007)
Date: 2007-09-30 06:53:57 UTC
From: Lake Hodges Radio
Topic: 12782 Message: 12782

Folks,

It's been a few years since this was mentioned in this group, so I thought I'd do this again for the new readers.

People sometimes try to pound square pegs into round holes by attempting to use GMRS for purposes it was not intended.

For emergency communications, for example, GMRS has been made to work in some areas of the country. But mostly, it is not effective.

I wasted a lot of money on GMRS radios a few years ago only to find out that Amateur Radio was what I really needed.

If you want to have a lot of fun with two way radios, and also have more effective emergency comms capability, my suggestion is to get an Amateur Radio Technician license and use 6 meter, 2 meter and 440 MHz repeaters.

There are THOUSANDS of Amateur Radio repeaters OPEN for use FREE in the USA and beyond.

Using Echolink (www.echolink.org), you can talk over repeaters from coast to coast and even in some counties in Europe and Asia.

ANYONE can get a Technician license. It's easy. 10 and 12-year old kids can pass the technician test.

Even the General license is easily doable if you're motivated, and that allows you to talk all over the world on HF or "shortwave" frequencies legally using as much as 1,500 watts.

Learn more here -->> http://www.hello-radio.org/whatis.html

Free practice tests -->> http://www.qrz.com/p/testing.pl

Join this organization -->> http://www.arrl.org/join.html

Visit an Amateur Radio club in your local area -->>
http://www.arrl.org/FandES/field/club/clubsearch.phtml

BUY a copy of the ARRL book "Now You're Talking" and you can have your Ham license in a month or less.

>report an emergency, but not for nightly watch group activities. I
>know that the group licenses are a thing of the past
>(unfortunatly). This woman actually suggested that we use CB, which
>I thought was pretty funny at the moment.

Chuck,

I'd have to say, I'm pretty sure she was wrong, unless there are new
rules that I don't know about.

As you noted, REACT has used GMRS for years and many CERT teams use
the cheap plastic FRS/GMRS combo radios. Occasionally, they even get
a GMRS license, but not very often.

There's also the NationalSOS initiative that uses channel 1 which is
a shared GMRS/FRS channel -- http://www.nationalsos.com/

The last time I called the FCC about GMRS, the person who answered
did not know what GMRS was.

If you talk to the FCC again, ask them to cite the relevant
paragraphs in Part 95.

well if you use GMRS each Family get a license or do a UHF business repeater FB-6 and rent service to the group.
Also if you do it as a FB-6 you can go to 100 watts output.

we have a number of FB-6 we rent service on .

From: kvsp1160@aol.com
Topic: 12772 Message: 12785

Can't see anything in the rules these days about organized groups using GMRS radios, as long as each user (unless within a family) is properly licensed.

I think the FCC operator was thinking you meant having an organization or business operate on GMRS. That you can't do: having a single license with multiple users.

Some of those operaters are useless down there. When I first heard about GMRS (way, way back when), they told me that it was discontinued and CB took over. They also said that CB now required a license again. ... You start to wonder who trains/teaches them over there. I think it took me four phone calls to get the answer I wanted, but many didn't know that even CB existed, or what CB was. =c)

The Icoms and Kenwoods are nice, also because the small whip antennas (which are pretty good on their own) can be easily and legally (with a GMRS license of course) disconnected so that an external antenna can be attached. The Kenwoods appear to max out at 2 watts (?) while the Icoms rate at 4 watts (input or output?).

A Google search for either Kenwood GMRS or Icom GMRS will lead you right to them.

Midland seems to make just the "little guys" which may be adequate but which will be less powerful and versatile.

That's certainly a good place to start - unfortunately, the rules/regulations are not written clearly, and omit specifics about uses that common sense would suggest are reasonable. I have read through these rules numerous times, and frankly, I always find myself encountering situations where the rules are ambiguous and require additional clarification. Unless you ask somebody, you are faced with either assuming that (1) if isn't mentioned, you cannot do it, OR (2) if it isn't strictly prohibited, then it is OK.

I too am a licensed GMRS operator - WQGT 447.

Calling the FCC or sending them an e-mail frequently results in a response that does not properly apply. They are often pretty useless.

From: qualitylights
Topic: 12772 Message: 12789

Thanks to all who have answered. Well, just to clarify, I was pretty clear about individual members being licensed when I spoke to the FCC rep. I told her that I understood there was no longer a group or organization license and explained to her that each member would be licensed individually. She stated that it still wasn't legal to use the service for organized or group activities.

As for parts 95 and 97, I have been through them both, several times, and can not find anything about organized group use, one way or the other. As stated, the rules leave A LOT open to interpretation. I took the advice of someone on the board and have sent and email off to Reily Hollingsworth of the FCC enforcement division. I know people who have dealt with him in the past and say he very happy to be able to help. I will post up his response on the matter once I have it and I guess that should settle the matter once and for all. After all, I don't think we can go any higher on the ladder to get an informed answer.

Thank you again to all who replied.

Chuck

12790. Re: [GMRS] Question about organized group use of GMRS

Yahoo group: GMRS (2005 — 2007)
Date: 2007-10-01 22:03:37 UTC
From: Walters
Topic: 12772 Message: 12790

Hello and Welcome to Chuck and the rest of the group,

I have not been in GMRS THAT long, however, long long ago GMRS was a mobile-to-base or mobile-to-mobile (portable - to - portabel also) ONLY service. That's right, if you can find an OLD OLD OLD set of rules you will actually find it spelled out that way. The service was intended for mobile or portable units to contact a base (ie a family with a house or other home and family mambers away from home calling home or vice-versa). There were group licenses as well.

Now all that has changed. There are no restrictions in the current rules prohibiting one base talking to another. There are only grandfathered group or business licenses left and they cannot renew if they attempt to make any major changes to their existing system. There are some REACT teams in this grandfathered state (and loving it).

I've read the other responses and agree with them. I am not sure what the FCC rep who answered the question was thinking. Especially in light of you saying "I know each person needs a license."

Sec. 95.101 What the license authorizes.

(a) A GMRS license authorizes a GMRS station to transmit messages to other GMRS stations at any geographical location within or over the territorial limits of any area where radio services are regulated by the FCC. These points are listed in Appendix A.

I bought a license. Now all these people can operate under my license;

(a) An individual GMRS system licensee may permit immediate family members to be station operators in his or her GMRS system. Immediate family members are the:
(1) Licensee;
(2) Licensee's spouse;
(3) Licensee's children, grandchildren, stepchildren;
(4) Licensee's parents, grandparents, stepparents;
(5) Licensee's brothers, sisters;
(6) Licensee's aunts, uncles, nieces, nephews; and
(7) Licensee's in-laws.

Of course if any of them want to operate their OWN system, they have to get a license of their own.

So how do REACT teams work within GMRS rules? Each team member who is NOT related to a license holder in a1-7 above must buy their own license. I have members of my family on my team (so should you, its fun) so we are all covered by my license. The members of the team who are not in my family (yes there some of those too) must buy their own license. At our 1st team meeting (after obtaining our charter) we reviewed all the personal radio services (FRS, MURS, CB, GMRS and Amateur). We did not consider a business class service. The team

voted to adopt GMRS as THE primary team radio service. Now we are helping each person get licensed and get a decent radio. In the meantime, anyone unlicensed can always use a .5 watt fully legal FRS radio on FRS 1-14 license free. I started by buying an Icom F21GM, 1,2,4watt repeater capable handheld. I then bought a mobile antenna and a ladder-line J-pole. I have now aquired a 10 watt commercial UHF mobile and had it programmed for operation. Another REACT Team gave us an out-of-service repeater and a member of the local Amateur club tuned and tweaked it and helped us get it setup.

My Boy Scout troop went on a camporee last weekend and I gave each leader an FRS radio, already set and locked on CH10 (one of the 500mw 467.XXXX freqs) and all PL'd the same. We were able to have telphone quality FM over the entire area of the camporee. I had not had a chance to really try this out in a real world application but it work3d perfectly.

OK, sorry to ramble on. Kept thinking of other tidbitts.

Subject: [GMRS] Question about organized group use of GMRS

Hello all.

I'm kind of a newbie to the hobbie (in it about 6 months or so) and I have a question. Now please, I am in NO WAY trying to start a flame war with this question. I just want some information that may benifit a local community watch group.

I called the FCC question hotline yesterday and was told that GMRS can not be used for organized activities, such as a community watch group, but I have noticed that REACT groups are a large user of the service. Is there a loophole that I am missing, or was the FCC rep that I spoke with not answering my question correctly?

Any help on this matter would be GREATLY appreciated as we are looking for a reliable, inexpensive method of communication for this group. I won a local repeater and would be more than happy to let them utilize it at night for their watch groups.

Thanks to all in advance for any information.

Chuck

12791. Midland GXT850VP4 Radio

Yahoo group: GMRS (2005 — 2007)
Date: 2007-10-03 20:24:57 UTC
From: Joe Ri
Topic: 12791 Message: 12791

I am looking at purchasing this radio. The only preference is that is has the ability to transmitt over 25 miles. I understand that is only when conditions are perfect with no obstructions.

Does anyone have this model? Here is the link of the model I am looking at.
http://www.midlandradio.com/comersus/store/comersus_viewItem.asp?idProduct=5522

I am open to other manufacters that may be better than this one.

thanks in advance.

Joe

12792. GMRS Operation Rules??

Yahoo group: GMRS (2005 — 2007)
Date: 2007-10-03 20:57:14 UTC
From: Joe Ri
Topic: 12792 Message: 12792

I would like to know, besides having the correct license to operate the GMRS radio, do you need to use specif protocal? Example: what the police department would use when communicating with other officers or their central station.

As you can tell, I really am an Ameture, but want to make sure I am operating correctly per FCC regulations.

Thanks

Joe

All the other models, including the ones that claim the more honest ranges of 6 miles, have the same 'ability' to have 25 mile range.

To actually get that range, one end has to be on a hill/mountain, so it's in view of the other end. If one end is 250 feet higher than the other, and there's nothing in between them, yes, you might get that range.

The reality is you will get 1-2 miles range in actual use in a city, maybe 3-4 miles in 'country' settings, on fairly flat ground, but not if there's a lot of trees in between. Trees absorb UHF nicely.

Range is almost entirely a factor of antenna height. I can talk to a space shuttle 150 miles away with 5 watts, no problem... because they're at 150 miles up, and directly in view. Line of sight.

You can buy better radios, for use in the GMRS service, commercial grade radios are available for about $125 and up. They have better quality receivers, and will do better, though the above all still applies.

Here's the rules:

http://www.access.gpo.gov/nara/cfr/waisidx_06/47cfr95_06.html

The basics are, give your callsign at the end of communications, or
every 15 minutes, whichever is less, no profanity, no illegal activity.

There's no specific rules, though you'll probably find that 'CB speak'
like 'good buddy' and all won't be well received by your fellow GMRS
users. Call who you're calling, either by name or by callsign, chat,
use your callsign, that's the basics.

For midland to claim 26 mile range, is outrageous.

Yes, if you were on a mountain top, and the party
you were wanting to talk to was on another
mountain top, clear line of site, with no co-channel
users, you might be able to talk 26 miles.

Real world however is 1-4 miles depending on
what is out there.

Even on the ocean, you would not get 26 miles, unless
you could get in the air - curvature of the earth would
come into play.

Thanks Skip,

So it sounds like unless I go with a professional grade, Midland and Mot. are about the same quality.

I guess this all marketing to justify getting twice as much money for the unit.

I didn't think about the curvature of the earth. When taking that into place, it all make sense.

Hi The Joe,

Welcome aboard,

No, do not use a protocol like the police (10 codes etc). Just speak naturally in sentences and plain language.

Learning how to operate in a run a NET environment would be good. 10-XX codes?, no.

Just follow the FCC rules. Give your callsign at the end of a transmission or every 15 minutes during a long transmission.

I got a similar response from the FCC on a similar question. I asked, for both GMRS and FRS, if folks who are not family or related want to use the radios for group activities such as wildlife watching or etc., would it be OK - and the answer was yes, every user may communicate with one another for these activities. GMRS must have licenses, of course.

Wow,

It was just too late when I typed this, what bad sentence structure, sorry. And its that late again! My middle comment was that you should learn how the "NET" form of radio use works. It helps when you have a group on the same ch/freq and have the need to have a little control. It does not have to be as formal as Amateur Radio.

Stan

Easy Question to all.

If you own/manage/control operator of a GMRS Repeater Eastern MA, can you please list it here.

MASS NET repeaters, RIGMRS, Westwood, Quincy and Bridgewater do not need to reply (I have them already). I am still wanting to create a new database in the Boston / Cape / Eastern MA GMRS Repeaters.

Please list
Frequency

Tone(s)

Location

Possible coverage area

Point of Contact for permission to use

Open/closed repeater.

Thanks

Hello all,
Please take a look at this Ebay item (Item number: 120167408212) which is a Midland model 70-245 BMX UHF Radio. This is a 16 channel 2 and 5 watt hand held without the battery or antenna BUT already programmed for all of the GMRS frequencies as shown in the ebay ad. I just purchased 6 of theses and I am sure they will sell fast in the $10 range!!!

I am going to use these as a few Low Power mobile units and also as an intercom between the house and the Ham Radio Shack. They require a 10.8 volt battery which are very costly and these units are rather heavy with the battery attached but make a great small base station with the addition of an 11 VDC 1 amp power supply. So all you have to do is provide 11 VDC and an MX antenna or an MX to BNC adapter and an external antenna. I am going to use my 12 volt supply and a series diode to operate it on 11.3 VDC which will be OK. These are not cheap Midland toy radios. They were sold to the Canadian Government and have been in service until now. A good commercial radio. Small as a base station.

12811. Re: Midland GXT850VP4 Radio

Yahoo group: GMRS (2005 — 2007)
Date: 2007-10-12 15:05:21 UTC
From: tdemarzo
Topic: 12791 Message: 12811

My CERT team had a local communication drill and we estimated the average communication distance for the GMRS radio's to be almost 2 miles in a heavily populated rural area. There were a variety of radio's used, but all were the longer range 1+watt radios.

Greetings,

How will did the radio perform in your Drill. I am in the process of looking for a radio for my CERT Team.

Thanks

Hi guru,

BTW, there is a mobile GMRS repeater available ?

Thank you very much for any info.
Regards,
Anton

Daniel,

I will be glad to let you know how they perform as soon as I get a chance to test them out.

If you don't mind, can you please tell me what CERT stands for?

Thanks

Joe

It's my opinion that a 'public use' service like GMRS (or FRS, CB, and MURS) should NOT be depended by emergency teams. During a real emergency, CERT teams need a dedicated PS frequency - even if it's shared with another public service entity !

We've all seen what happens to cell phone service (and even Nextel) during blackouts, tornados, hurricanes, and other wide area disasters... such radio services quickly become overloaded and useless.

Additionally, despite what the manufacturers claim about 'up to nn miles', GMRS, FRS, and MURS are short range services - rarely providing coverage for more that a mile or 2 without a repeater. To reliably obtain the '25 miles' spoken of earlier in this thread that would be useful through a real disaster you would need a dedicated repeater located at a secured site, on a hill/mountain, and a significantly large backup power supply like a generator and large fuel supply). If you do not have the funds for 'real' public service radios, how will you handle/fund the maintenance & operation of a large repeater setup !

Hello Joe,

Sorry I am not Daniel but I'll cut in with the info on CERT.

Community Emergency Response Team, you can read about it here

http://www.citizencorps.gov/programs/cert.shtm which will take you to the next one.

https://www.citizencorps.gov/cert/

And many communities have CERT teams and training

http://www.sandiego.gov/fireandems/cert/index.shtml
http://www.state.nj.us/njoem/emb_cert.html
http://www.nyc.gov/html/oem/html/cert/cert.shtml
http://www.fremont.gov/Fire/SpecialPrograms/CERTMembers.htm
http://www.ci.austin.tx.us/oem/cert.htm

Town after town has CERT. These are just a few from millions of Google hits. CERT is used for several other things as well but this is the one we are talking about here.

Very good program for preparedness minded people. Be the 1st on your block to go CERT. Look up your community's Office of Emergency Mamgement and get CERT training.

From: Anthony Mikulastik
Topic: 12825 Message: 12825

I have decided to sell my Kenwood TKR-850 UHF Repeater with DB Products Full Size Duplexors. It is on the air in Temple, TX on 444.500 123.0 tone. The package comes with programing cable and software. I am asking $1650 for the complete repeater syaytem. The repeater is type approved for commercial and GMRS if not used for amateur. Call Anthony at 254-493-8595.

12826. For Sale - Kenwood UHF Repeater with Duplexer on GMRS

Yahoo group: GMRS (2005 — 2007)
Date: 2007-10-17 15:04:30 UTC
From: Lake Hodges Radio
Topic: 12825 Message: 12826

If anyone is looking for a Kenwood GMRS repeater on 462.575, please send me an email and I will send you details on one we have for sale.

(It can be easily programmed for other GMRS repeater pairs.)

It is on the air near San Diego and works beautifully.

does not cover duplexer or antenna.

that would depend on your needs.
the location of antenna is sometimes = on what type of duplexer you need.

I mostly use DB products for antennas
TX RX for duplexes

So, when the whole system is complete and functioning, repeater, duplexer, cables and antenna, will the total cost be closer to $400 or $800?

The $235 price seems confusing.

12836. Repeater system total cost?

Yahoo group: GMRS (2005 — 2007)

>line. We will need prices to see if it will work into the budget.

Adam...

John may have better answers, but I have found that people who set up repeater systems on the cheap usually regret it.

First, you need a good reliable repeater, preferably one that includes a duplexer.

Then you need a good antenna with sufficient gain to cover the area you want to cover.

I would use a coax feed line that is fairly new, or lightly used. You don't want a lossy old line to ruin your signal.

Then, I'd think seriously about emergency power, if you plan to use the system for emergencies.

Deep cycle batteries can keep you going for brief periods, and a generator of some type will keep you going longer. You also need enough reserve fuel in the tank or tanks. During the huge wildfires in CA four years ago, many repeaters were off the air because of no power for five days. The ones that did stay on were powered by diesel generators that were refueled every 96 hours.

So... I'd plan on $250 to $800 for a decent repeater plus $100 to $300 for a duplexer. $100 to $500 for a gain antenna and $50 to $200 for the feedline, depending on length.

Deep cycle batteries plus charger, maybe $70 to $300 depending on how long you want them to power the system in an outage. Generators are $150 used up to $$ thousands for big diesels.

If you want reliability -- be suspicious of inexpensive used gear unless you are very technical and can do your own tuneups and repairs.

If you're doing this for emergency preparedness, investigate whether you can get grant money from somewhere. Look for complete used systems from governments or commercial radio companies that are upgrading from UHF to 800 MHZ or other systems. They are usually well-maintained and can be sometimes acquired inexpensively.

Unless you are already well-educated on these topics, spend as many hours as you can reading stuff like this -->> http://www.repeater-builder.com/rbtip/

The more you know, the fewer mistakes you will make.

Other than that, I don't know much more. I certainly am NOT an expert on this.

Good luck,

-- Kurt

12837. York County REACT

Yahoo group: GMRS (2005 — 2007)

From: Lake Hodges Radio
Topic: 12240 Message: 12837

Hey, Stan, thanks for that report!

I was born at York Hospital and played with CB's and ham radio as a kid.

I was briefly involved with REACT in York around 1967 or 1968. I think that team shut down, but it looks like you started a new team.

It's great to read that my home town is preparing itself for anything. Especially after the TMI fiasco in the 70's and your close proximity to Washington.

Let's hope you never have to use that equipment.

Does Channel 43 still have a tower up on Queen Street Hill? (I worked there years ago). Maybe they'd host an emergency repeater and antenna in their transmitter building, especially if they were asked by someone at the hospital. Why not check with the station manager or chief engineer?

There are also probably some Ham repeaters and towers around, and maybe they'd have room for you.

15 miles range on GMRS is good, but from a higher elevation you'll do better.

It would be nice if you could communicate with stations in Harrisburg and Baltimore. With the right equipment and antenna location, I think that should be possible.

73,

Kurt

Nextel to two-way radio interface cable or box?

?

Has anyone seen or used and interface that connects a Nextel phone "walky-talky" function?to a standard two-way radio? One search turned up a Incident commanders radio interface with more function and price than we need.

Paul

The price is for a working repeater as they are in service as of time of this email.

I would have to go to the tower sites to get them when I sell them.

As for the other parts I have them available.

Duplexes from $100 to $500 used but will have to be tuned.

Antenna have some used DB-420 and a DB-413 soon but asking $300.00 each.

cables made and ordered it needs. Some RG-8 cables no charge if you buy the other.

thanks John

12840. Vertex VXR-7000 UHF repeater system FS

Yahoo group: GMRS (2005 — 2007)
Date: 2007-10-19 18:19:19 UTC
From: na6df
Topic: 12840 Message: 12840

It is:
Vertex VXR-7000 50 watt UHF repeater (~$1200 new)
Telewave TPRD-4544 BpBr duplexer (lists at ~$1367 new)
Motorola preamp w/ motorola Bp cavity in front of it.
GE MASTR III Cabinet with N feedthrough and top mounted cooling fan.

Great system! Can program and tune, if needed.
$1700 programmed/tuned. I do not want to ship this stuff, but would be willing to deliver within a reasonable distance of Auburn, CA. I can also bring to Pacificon if needed.
This would be a great Ham, Commercial or GMRS system.

What is it you're REALLY trying to do?

It's not for the faint of heart [or wallet] to interface
dissimilar 'radios' together.

Typical units are the ICRI, ACU-1000 {JPS/Raytheon], ACS3 [ACS
Communictions].
Most devices are intended for Amateur and Public/Safety use.

Home brew devices are best left to the technically inclined.
And there may be issues of connection to the telephone system if
Nextel is used.

I was talking with my radio tech this past weekend about this same topic. He said that there already is an interfacer for nextel to radio on the market. It is currently made by Motorola for their high end 800 MHz trunking radios. It is like ka1jfy said though. NOT for the faint of wallet.

ka1jfy <walter.howard.jr@...> wrote: What is it you're REALLY trying to do?

It's not for the faint of heart [or wallet] to interface
dissimilar 'radios' together.

Typical units are the ICRI, ACU-1000 {JPS/Raytheon], ACS3 [ACS
Communictions].
Most devices are intended for Amateur and Public/Safety use.

Home brew devices are best left to the technically inclined.
And there may be issues of connection to the telephone system if
Nextel is used.

Celwave model 201-7
fiberglass antenna
8 dBd gain
150 watt
450-470 Mhz
100" in length
Perfect for GMRS base or repeater.
Used for one year and stored in my garage the rest. I'm in San Diego
and would like to find a local buyer to avoid dealing with shipping.
Pick up in Ontario is also possible.

$200

Since the RHINO radios cannot use repeaters, it doesn't matter much,
I'd say. They do not support repeater operation, only simplex.

The Rino 520 is packed not only with GPS features, but with UHF features as well. It has repeater access (duplex), is 0.5/2/5 Watt switchable power and has user adjustable squelch, channel scan and vibration alert mode.

As for the data I have asked the question before, I dont think it will go through a repeater just the FRS side.

Yes, I am aware the Rhinos only do simplex. My question goes to whether or not the actual data stream gets passed, so that position reports can be monitored from a greater distance than the radios themselves can be monitored. The application is for SAR teams in the field.

Er, you don't seem to understand 'simplex'. While I now see that ONE of the RHINO radios does allow repeater use, (the 520), unless YOURs does, the repeater never comes into it. Simplex does not go through the repeater.

If you ARE using a repeater, with that one unit, then it becomes a possibility. It would depend on the repeater, since I expect the 'data' is a low frequency encoded tone, like a DCS signal. Some repeaters will 'pass' low tones (like CTCSS tones/DCS tones), and some won't. I'm sure a repeater could be MADE to pass the data tones, by someone who understands repeater design.

Repeaters don't listen to the output channel, only the input, which the mobile/portable only transmits on in repeater mode.

Technically, you could design and build a receiver for placement on a mountaintop that would monitor the simplex transmissions, copy the data, and relay it by wireline to your base, though it can't be a transmitter, under GMRS 'no interconnect' rules.

It sounds like the newer units are substantially more feature -packed than
the ones I saw! We are looking at the possibility of building a
field-deployable GMRS repeater, or digipeater, that will pass the Rhino Data, and convert
it
for retransmission on the APRS network. Sort of like using the Rhinos as
wireless microphones for the ham network. Yep, I know this will mean having lots
and lots of licences, but the Rhino seems to be very popular in the SAR
world. I guess I will just have to see what the data looks like from a Rhino (
Darn, I have to buy more radios!) I have not been following the GMRS world,
and I am a but out of touch. Did they ever settle the question of whether
simplex repeaters are GMRS-Kosher? Thanks for your help.

Allan... Read the rules of the service before starting ideas, please.

Both FRS and GMRS have rules prohibiting digital modulation. The
GARMIN RHINO units operate under a specific exemption granted to them
alone to allow them to send digital data. You are not allowed to
send it via GMRS.

95.631 (in part)

(e) No GMRS or CB transmitter shall employ a digital modulation or
emission.

(f) No GMRS, CB or R/C transmitter shall transmit non-voice data.

A GMRS repeater which repeated digital data would very probably be in
violation of this rule. (The FCC has been known to have supremely
odd opinions when asked, sometimes they offer answers to questions
that are directly opposite the official rules...)

As you can see from the other postings, it appears the re-transmission of the data packets may be at issue. If they can be repeated as sound, and as they're transmitted from the radio, not store and forward, then... I would suggest you read Part 97 and make your own decision.

I don't have one of these units. But my test would be this: does the Part 95 TYPE ACCEPTED (not export) radio transmit data on a GMRS repeater input channel? If yes, I would expect the FCC would expect it to be repeated. If the radio firmware only allows the transmission of the data on FRS, simplex channels, then you're out of luck. Put another way, if you try to make the radio do something it wasn't designed to do, you're likely breaking the law.

But one thing I clearly think is permitted, reception of the data at the repeater site on the input frequency, then forwarding elsewhere, via some medium other than GMRS, e.g. a dialup or DSL modem. The data could be collected at the high site and brought back to a CP.

Since this radio appears to go beyond the current Part 95 R&R, does anyone know where to find documentation of the exceptions that were made? Repeater operation may have been discussed by the FCC in the radio's type acceptance.

Sounds like you're on to a very cool application. The only other thing I could think of would be a Motorola XTS5000 radio with the optional GPS public safety microphone. With this radio you could use it other radio services that aren't technology-phobic. Just a word of warning, you're likely talking over $4k a radio even with deep government discounts.

Again, all this is my opinion. You have to read Part 95 and made your own decisions.

The modulation type would remain F3E. So if I understand your position correctly, a repeater that received and reboradcast the audio signals transmitted by the Rhinos under their unique exemption, would then be in violation of the rules, as would the competing GPS enabled FRS radios? What about the digital coded squelch? Prohibited by these rules as well?

The Garmin RINO 530 does not send position information out on the
repeater channels. It will only send it out on simplex. If you
look at the tool bar on the top of the screen it will show a flag
for position sending. If the flag is a lighter shade it is ready to
send the position. It will stay dark on the R channels as it is not
set up to send position over repeater pairs. Regardless of the
rules that is how the product works.

Garmin got a special exemption to allow the passing of GPS data ONLY
on the FRS [simplex] channels in 2001.
Original exemption
<http://www.fcc.gov/Bureaus/Wireless/Orders/2001/da010851.txt>

The amended Part 95 section 193a [FRS Rule 3, amended March 2003]
allowing location information on FRS for all manufacturers is at
<http://preview.tinyurl.com/2w8nbt>

There are no provisions within the GMRS rules for similar services.

Really good info. Thanks for the references.

I still think you could put up an RX-only site to gather the location data then route it to a CP via another medium. That might help with the S&R application. But if you want to be able to poll the devices, then you would have to stick to FRS.

Since it's now legal for any FRS radio to do this, does anyone know of another brand that's doing the same thing?

Look at what another SAR team is doing regarding Rhinos and SAR.

http://preview.tinyurl.com/3b2ypv

Sounds like you could put a Rhino in an advantageous position,
connected to a PC, and take the Rhino locations and pass them to APRS.

Walter,

I manufacture the Micro-Trak APRS transmitters using the Byonics TinyTrack processors. (_www.byonics.com/microtrak_ (http://www.byonics.com/microtrak)) We intend to make a portable digipeater for APRS transmitters based on the new TinyTrack 4 controller (_http://www.byonics.com/tinytrak4/_ (http://www.byonics.com/tinytrak4/)) which is still in beta testing, but scheduled for release in the very near future.

Knowing that many SAR teams use Rhinos, I had hoped to be able to provide a digipeater for Rhinos by using FCC approved GMRS/FRS transceivers under control of our processor. The consensus from this group (generally, but not entirely, politely...) seems to be that there is no permissable way to do so. It does sound as if providing a cross-band, uni-directional digipeater would be of some value. We would receive and decode the Garmin format GPS postion reports, reformat the packets as APRS standard format, and transmit them on the North American frequency of 144.390 Mhz, or other tactical 2 meter frequency. Doing this with a microcontroller rather than a PC allows something along the lines of a "lunchbox" didgipeater, that can be carried and placed on high ground by SAR teams. This would allow the base to see the location of the field assets, but would not provide extended range positon exchange reports to field personnel. Too bad....

Thanks for your very helpful information!

Allen

Ok, try, try again. Before planning on these wonderful ideas, go
read the rules for the services you intend to use! Most especially,
read all sections entitled 'authorized communications'
and 'prohibited communications'.

97.115, Prohibited Communications (Amateur Radio)

(e) No station shall retransmit programs
or signals emanating from any
type of radio station other than an
amateur station, except propagation
and weather forecast information intended
for use by the general public
and originated from United States Government
stations and communications,
including incidental music, originating
on United States Government frequencies
between a space shuttle and
its associated Earth stations. Prior approval
for shuttle retransmissions
must be obtained from the National
Aeronautics and Space Administration.
Such retransmissions must be for the
exclusive use of amateur operators.
Propagation, weather forecasts, and
shuttle retransmissions may not be
conducted on a regular basis, but only
occasionally, as an incident of normal
amateur radio communications.

And, 95.194 (in part)

(d) FRS units are prohibited from
transmitting data in store-and-forward
packet operation mode.

So, no, you can't make an FRS 'digipeater', nor can you retransmit
FRS communications on ham radio.

Not disagreeing with you, but you should update your rules. You're quoting from 97.113, not 115. There have been some recent changes also. I don't think they effect your point. For example, what was 'space shuttle' is now 'manned spacecraft'. My source:

http://www.arrl.org/FandES/field/regulations/news/part97/

About the Part 95 quote, you may want to check the exception that was posted yesterday. Yes, the FCC sometimes breaks their own rules.

I think the issue of retransmission of other data in the APRS network has come up before in their mailing lists.

Also, keep in mind that S&R is rarely done in a non-emergency mode. However, I don't think drills and equipment testing could be considered an emergency.

"§97.403 Safety of life and protection of property.

No provision of these rules prevents the use by an amateur station of any means of radiocommunication at its disposal to provide essential communication needs in connection with the immediate safety of human life and immediate protection of property when normal communication systems are not available."

Again, none of us can made the final decision for someone else. We can only speak on how WE interpret the rules.

Ray

The rules do seem on face value to prohibit FRS digipeating, which is a shame. It would be nice to develop a Ham radio based on the Rhino, but absent that, lets see what is possible. I will ask for a ruling on whether FRS data, monitored, screened, and retransmitted as ham band APRS packets constitutes a violation of the rules per se. The issue of cross-radio service connections has arisen before, and included questions such as whether 49 Mhz wirelsss radio microphones or bluetooth constitutes a violation. If there is interest in such things, I will post the enforcement peoples response.

Thanks for all your good information,

Allen

How about decoding APRS data and making a voice announcement, arguably emitting F3E voice rather than "data?" A computer with voice recognition could be used for the APRS-IS gateway. Might it not even be possible to implement the device as a separate receiver/demodulator/speech synthesizer going to a speaker in front of the microphone of an FRS radio, as long as the device is not "attached" to the FRS radio within the meaning of 95.194(c)?

Alternatively, how about adding speech synthesis to the TinyTrak4 so that everything would be F3E voice so as arguably not to be transmitting "data" in store-and-forward packet operation?

Hmmmm, I have to admit that your post left my brain hurting.....Essentially, your argument is that by changing the format, we can possibly circumvent the store and forward rule, or by using an acoustic coupler, we can circumvent the rule relating to the definition of "connected". Not something I would be willling to bet 10,000 dollars and one year in prison on.....I like where your head is at though! I suppose we could add a voice module to the TT4 if it was really a desirable feature.

I e-mailed Riley Hollingsworth @ the FCC this morning to ask his opinion of what the regs permit. The cross band and radio service issue seems problematic, but maybe this is just an illusion. Maybe I can have a waiver... I was also considering the feasbiltiy of using a 1 Watt license-free spread-spectrum transmitter as a drop-in uni-directional digipeater, so his answers may have a wider scope than just the ham link.

I need to find a hard-core hacker that can reconfigure the Rhinos to the 70 CM Amatuer band and solve the problem the easy way! I can saw the antenna off a Rhino and build a "transverter" (perfecty legal under ham rules-we can convert Micro-Wave ovens to transmitters if we get the urge!) But it would be very ugly.

My oops on the cite, it is indeed 97.113.

My source is the US Government CFR website, which is supposed to be
current, but, it IS government, right?

http://www.access.gpo.gov/nara/cfr/waisidx_06/47cfrv5_06.html

links to Parts 80-101, which is what most of us care about.

This is the 'as of October 1, 2006' data, the data for this year isn't
yet up.

This quote from the rules raises a question I've had for some time. If I somehow one day I become thrust into an emergency in which a call from my VHF two-way to a Ham operator is the only feasable means of communication, would that be OK?
I have a company radio in my vehicle and I programmed several local Ham channels in it but obviously don't use them since I don't have a Ham license.
Curious.
Thanks,
Danny Harmon

Any radio service can be used by any person in the event of a life threatening emergency, vessels in distress, aircraft "Mayday" calls, or the retransmission or assistance to the person making these calls. Additionally, there is a doctrine of the common law called "necessity" which provides a defense to prosecution for almost any prohibited act in the preservation of life, for instance, starting a forest on fire to summon rescuers to lost hikers, or eating spotted owls, dolphins, or bald eagles in a bona fide survival situation.
This being said, I would avoid programming your ham radio to the local police dispatcher's frequency and reporting vehicle accidents...

Hi folks
Question on GMRS range.

I have seen some very large estimates quoted by some radio manufactures as to the effective transmission ranges of there radio's, an example would be the Midland 710 series, tx at 5 watts equals some 20+ miles

What are the real ranges under normal useage conditions of a 5 watt rated GMRS radio!

Thanks in advance

That's GOOD advice about the police frequency, Allan. Thanks! :-))
However, I must admit one transgression from your list: We enjoy fried bald Eagle every July 4th at my house. It's an Independence Day tradition! Tastes almost like Manatee.

Hello there,

The general rule of thumb is one mile for every watt of power. At UHF freqs height is more important. Triple your height and double your distance. If you are standing at street level with a GMRS radio at 3 watts and hand held at about 5 feet, you can expect 3 miles in open terrain. UHF penetrates building material fairly well and can bounce off buildings also. Now either move to a location that is 15 feet higher or put an external antenna on a the top of a 15 foot mast, you can now expect 6 miles. Tripling power at street level will not yield the same improvement that the increase in height will give you. These numbers are for comparison sake and not neccessarily what you will see in any particular situation. Nor did I account for any atenna gain produced by switching to a mast mounted antenna. There could be many factors in your equation. I can tell you this as a fact. Perched on a good size hill with a GMRS J-Pole hanging down from the top of a 20 foot mast, 35 feet of RG-8U and transmitting 4 watts out at the radio, I spoke to a 500mw FRS station on FRS 1 at a distance of 9 miles. The FRS opertaor was also on a high point of ground so we had only one high ridge line between us. Copy was very readable over a 5 minute conversation. Your results will vary.

Hi Darren,

If you study for your ham ticket or amateur radio license,
you can work the world, especially if the band is open on hf frequencies.. You'd be surprised what 50 watts and a dipole wire antenna can accomplish, when DX is running great on 20, 17, and 15 meters. Just a thought ! I usually use GMRS at country fairs and carnivals to keep track of the kids.. Good luck!

With a pair of Cobra handhelds that are transmitting about 3 watts I can get 3-5 miles in flat, open desert. Range is much less in a suburban area with trees and 2-story buildings - as little as one-half mile.

Where do you get the info that the Midland 710 is transmitting 5 watts. I looked at the Midlandradio.com site but couldn't find this specified.

I would all but gurantee than ALL Midland "bubble pack" radios
transmit at less than 2 watts ERP. There may be 5 coming out of the
transmitter, but only less than 2 make it out of the antenna.
This is a MAJOR draw back of bubble pack radios.

Thanks for the info on my range question.

I live in the UK, while GMRS radios are illegal to use here they do seem to be popular, this is due there superior range over our pmr446 radios (samiliar to your FRS) and there cheap price. £1 =$2 nice for us ;-)

I also read that the US Army have been using FRS and now GMRS radios for inter-squad & on-base chat, there standard personal radios just dont have the range.

Ps
The midland website have there GMRS radios listed by range, 18, 20, 26 miles. They also put the suggested range on there bubble packaging

Inter-Squad Radios (ISR) use 398-399 Mhz, and are modified FRS radios. The ones I have used are not worth the powder to blow them to hell....

Like they say, you mileage will vary. Mileage ratings for bubble pack radios are just for marketing purposes to look more attractive to the next radio. They are highly overrated. GMRS radios will have more range due to the higher output power and the potential to connect external antennas. If I recall properly, PMR446 has the same power and antenna limitations as our FRS radios. The only use in the States for PMR446 radios would be for the 440MHz amateur radio band. (I am temporarily ignoring the type acceptance attributes or lack thereof).

As far as the US Army, they have been using any available type of cheap two-way radio gear, much to the irritation of the command staff, as the authorized equipment has not been readily available at the man-level. Pity. One of the problems with FRS is the radios are not encrypted which can give away tactical positions or maneuvers.

cheers,

kevin

"I also read that the US Army have been using FRS and now GMRS radios for inter-squad & on-base chat, their standard personal radios just dont have the range."

As I understand it the squad radios are ICOM IC-F3-S3 radios deliberately limited to 100mw, even though they are capable of 5 watts. The power reduction is to limit the range of transmission, and deny communications intelligence from enemy forces who would be monitoring those frequencies.

Unfortunately, some army troops have found out how to unleash the full 5 watts of power - and by doing so, are unwittingly endangering the safety of the troops they are responsible for.

If you think that I am blowing smoke, consider that my background is military - specifically as part of a unit that dealt with communications intelligence.

Duane

This is untrue. Antenna height is more important than power. A 5 watt HT will not get 5 miles. A 500 mW HT could get you over a mile.

Antennas and terrain play more than power.

Those Midlands do *not* have 5 watt outputs.

You'd be surprised on the real outputs of these radios. FCC data searched by FCC ID gives the true story.
Those radios are rated less than 2 watts ERP output.

Mileage claims are inflated to sell radios.

Exactly so. That's how they can advertise them legally as "5 watt".

The military uses similar radios... but NOT FRS or GMRS. These radios are designed to operate on military frequencies. They look like FRS, but operate on dedicated governement frequencies at reduced power.

Actually, if anyone used ANY analog, unencrypted radio for any tactical purpose, they're putting lives at risk. A tall receiver or hidden remote receiver would pick up ANY power level.

GMRS radios are just fine for 'hey, dinner's ready', but I would hope the military leaders would ban them for any sort communication related to the mission.

Same hope for domestic use. No SWAT team should be using this type of radio for any type of assignment.

The tricky part is getting non-tech people to understand why they need to sometimes put down the 'fun' radio and pick up the heavy 'work' radio.

I also remember hearing that the military was 'allowing' troops to use consumer GPSs because they didn't have (or didn't want to have) enough of the military version units. It was so bad that our troops were asking family to send them GPSs.

BTW, Icom made a special model of the the IC-4008A FRS radio for the US army for InterSquad comms.
It's called the IC-4008M
Still 14 channels, and .5 watt, but using frequencies in the 396 to 398 Mhz military band.
Icom was asked to do this because too many troops were buying FRS stuff, and using it in the field.

12893. How to Connect to Speaker System

Yahoo group: GMRS (2005 — 2007)
Date: 2007-11-18 01:01:49 UTC
From: zod111
Topic: 12893 Message: 12893

Is it possible to connect a GMRS/FRS radio to an external speaker system. For example, to be used at events where the speakers are stationary, but the commentator is mobile, moving about the event. One radio is attached to the speakers, the commentator has the other.

I have tried creating this setup at home using regular powered speakers, but while I can physically connect the units using a 2.5mm to 3.5mm cable, I remain unable to actually broadcast thru the speakers from a distance.

Is there a way to do this?

Thanks, -Barry

Sec. 95.193 (FRS Rule 3) Types of communications.

(a) You may use an FRS unit to conduct two-way voice communications
with another person. You may use an FRS unit to transmit one-way voice
or non-voice communications only to establish communications with
another person, send an emergency message, provide traveler assistance,
provide location information, transmit a brief
text message, make a voice page, or to conduct a brief test.

As above, not a legal use of FRS. Wireless microphone (possibly with
several receivers spotted around, if it's a large area) is the legit
way to go.

While many professional wireless mic systems work in the 470-802 MHz range, you have to keep a few things in mind....

This range is also the UHF TV band. Channels 14-69. Before selecting a unit, make sure they channel it's in is NOT an analog or digital TV channel in your area. If it is, the mic won't work or will have very limited range.

Also, 700-802 MHz will cease being TV in 2009 (unless the American public realizes what Congress decided). Don't get a new system in this range because it will become Public Safety spectrum.

These are professional systems are you will be expected to have a license. Most are used by broadcasters under a broadcast aux. license. The FCC is considering new uses for unused UHF channel in some areas. They call this 'white space'. Keep an eye out for developments there.

Other systems that use low band (40-50 Mhz) or 902 MHz may be legal without a license, but the quality and range is much lower.

Try a taller, higher gain antenna on your receiver and you'll likely get much better range. If the area you need to cover is in one basic direction, a somewhat directional antenna helps. Or have multiple receivers on the same channel and let the board operator pick the one with the cleanest signal.

Barry,

Lets assume for a moment that you need to add amplified speakers to a FRS radio, because the other operator is deaf....perfectly legal. What I am not sure about is what you mean by not being able to have it work at a distance. Do you mean that the radio will not broadcast over your intended range? Or that the external speakers don't have any, or sufficient sound output? My guess is that you have a wiring and/or impedance matching problem. I have been able to plug an FRS radio into a high-efficiency horn speaker directly, without even an external amplifier, with good results. (for use at a base station, not as a PA system)

When I say ³unable to actually broadcast thru the speakers from a distance,² more specifically there is no sound coming out of the speakers, regardless of distance. The radios are connecting to each other correctly. I wrote to the group because if as suggested there may be a wiring and/or impedance matching problem, how can I solve that?

From: Rob
Topic: 12893 Message: 12900

Aside from the legal issues using GMRS in a special event speaker system, you also have practical issues.

Anyone else with a GMRS radio and the knowledge of how to change the squelch codes can play havoc with your public address system. I would think your average teenager with a GMRS radio who was also smart enough to figure out your set up would have a great time hi-jacking your audio. In a crowd of people it is not unlikely to find members of the public who understand 2-way radios and have them with them to keep in touch with each other.

You may want to skip the GMRS and go with a legal and more secure alternative like wireless mikes.

12908. Re: [GMRS] Black Friday Sale!!!

Yahoo group: GMRS (2005 — 2007)
Date: 2007-11-26 22:36:07 UTC
From: Rob
Topic: 12903 Message: 12908

UsedRadio.com has new TC-500s for $125 as their regular price:

<http://www.usedradio.com/product54.html>

Good folks to deal with as well.

Robert Dodson wrote:
> Sorry good point your purchase may be either the HYT TC-500 or the Blackbox radio both are exactly same radio as they are made by hyt but some are stamped blackbox. However if, you choose the blackbox stamped units you will only have a 1yr warranty instead of a 2yr warranty.

12909. Response from FCC et al on GMRS/APRS

Yahoo group: GMRS (2005 — 2007)
Date: 2007-11-28 19:25:33 UTC
From: CaptALord@aol.com
Topic: 12909 Message: 12909

Here, as promised, is the FCC response regarding whether or not a GMRS location signal can be digipeated as an APRS signal.

Forwarded Message:
Subj: FW: GMRS and APRS Question Date: 11/28/2007 9:42:47 A.M. Pacific Standard Time From: _Riley.Hollingsworth@..._ (mailto:Riley.Hollingsworth@...) To: _ALORDNAPA@..._ (mailto:ALORDNAPA@...) Sent from the Internet _(Details)_ (aolmsg://0401f318/inethdr/2)

Hi. Here's the answer we got back from the rules Guru. Thanks

_____
From: William Cross
Sent: Thursday, November 08, 2007 2:22 PM
To: Riley Hollingsworth
Subject: RE: GMRS and APRS Question

Could be OK if the situations meets the test in 95.183(a)(13). This is the only situation where GMRS/Amateur communications is allowed.

To: Riley Hollingsworth
Subject: GMRS and APRS Question

Riley Hollingsworth
Enforcement Bureau
FCC

Sir,

I know you are very busy and hope that my question is not too complicated to be handled easily. My question is whether or not it would be permissable to construct and operate a uni-directional, cross-band digipeater that receives the proprietary Garmin "Rhino" data positions, screens out call signs not identified as Search and Rescue units, and reformats the information for transmission on the Amatuer Radio Services APRS network. This assumes a properly licensed control operator of the APRS side, and properly licensed GMRS users on

the input side.

Best regards,

Allen R. Lord
VHS Special Services

Boy, so unless you are sure that transmitting the Garmin data is an emergency messgage, the answer is NO. Therefiore why would anyone build the thing for only the extremely limited use it might get. You could not use it in a drill and testing would be impossible. Only chnace to use it would be in a live emregency.

From: John Marcel (K1FDD)
Topic: 12909 Message: 12912

I would say not necessarily in that the original question posed to the FCC was of the Garmin System (on GMRS) could more/less be tied into Ham Radio APRS (on Amateur Radio). I've always been under the impression that cross-service traffic has never been allowed or at least looked favorably on. The part-95 section listed below basically says unless it's an emergency a non-ham can't talk on a ham frequency. Much like in Theory a Non-GMRS Licensee can't transmit on GMRS frequencies (we know the reality). So even though I'm licensed for GMRS and Amateur Radio, I can't set up any sort of patching between the two, voice, digital or otherwise.

Now the Garmin-Rino thing muddys the GMRS waters by allowing "Officially" (according to what I'm reading here and in catalogs), non-licensed users to access GMRS frequencies for "Data" only. The radios still use Channels 15-22 in voice too, so what's the point of the license?

I'm curious is anyone has written the FCC and asked straight up, "Why is non-licensed data being allowed on frequencies voice users must obtain a fee based license for?" I'd be curious to their answers to that. They're willing to take the $85 I just shelled out to relicense and could've used on something else. What do I get for that?

It is actually a good thing that they haven't used that gmrs channel for anything since 9-11 when it was very active. They use the gmrs channel as a gathering place for their members and families. Any emergency traffic is handled on emergency channels according to which branch of enforcement they are with. They don't need gmrs for that except when their regular coms went down like on 9-11 and that big blackout around 2003 when that gmrs channel helped them out. They have a bunch of repeaters around the NY area. I can hear one when I go to Albany but only heard conversations a few times on it. Regards, Brian.

Merry Christmas to the city with the statistical best chance of snow on Christmas Eve. Boy I don't miss that!

Simmer down, John.

GPS data is not permitted on GMRS, 25 kHz channels. These are the ones you need a license for.

It's only allowed on the FRS 12.5 kHz channels [7 of which happen to be shared with the GMRS 'interstitial' channels].
Channels that any Tom, Dick or Harry can get on legally with 1/2 watt or less.

I don't agree with you on that. I live near some of them and I monitor the 8 gmrs inputs on my scanner and they are always on 467.600 going in to the repeaters in my hearing range (Queens and Nassau). Several times I transmitted on the input to see if I would interfere with them and it did. I know thay have some doppler stuff so I won't make a habit of that but it proved it to me at least. Regards, Brian.

I have to disagree with you on that one. I live near these guys and I scan all 8 inputs and hear them all the time on 467.600 going in to their repeaters. I have even transmitted to see if I can interfere with them on 467.600 and I have. I won't make a habit of it because think they have doppler tracking. I live near them and can hear some of them in Queens and Manhattan. Give me any other frequencies and I will put them in my scanner and see if they are active. Regards, Brian.

Why not list the out of band channels so that everyone can verify them?
That will end the controversy once and for all...

From: John Soto
Topic: 3754 Message: 12918

I also have been monitoring 467.600 and sometimes I could hear some of their members on the repeater input (467.600)... so, it seems that their repeater are using the proper gmrs pair.

John

Brian <tclimber222@...> wrote:
I don't agree with you on that. I live near some of them and I monitor the 8 gmrs inputs on my scanner and they are always on 467.600 going in to the repeaters in my hearing range (Queens and Nassau). Several times I transmitted on the input to see if I would interfere with them and it did. I know thay have some doppler stuff so I won't make a habit of that but it proved it to me at least. Regards, Brian.

I had read that message when it first came out and tried those frequencies and pl's but they didn't work. I think some people just don't like cops so they make up garbage about them and post it in forums like this. Life goes on, Brian.

Oh come on. It is obvious that they are discouraging others from using the frequency. The constant repeaters IDs and announcements (which are illegal) are designed to chase people off. They want their own private GMRS channel, which is not cool.

It doesn't matter whether they are cops, firemen, pastry chefs.. whatever. They are not entitled to their own GMRS channel.

12924. GMRS Licensing Unenforcable?

Yahoo group: GMRS (2005 — 2007)
Date: 2007-12-21 09:13:38 UTC
From: vade12
Topic: 12924 Message: 12924

This is one question I've been asking myself a lot lately. Has the GMRS licensing requirement become unenforcable? I just recently bought a "bubble/blister" pack FRS/GMRS radio and obtained my GMRS license to go with the radio. At certain times as of late, I've been feeling that I've wasted my money to get the license because of the high staturation of unlicensed "bubble/blister" pack radios out in use by the genernal population.

I've discussed and have gotten into many heated arguments regarding this issue with many of my friends and they're sick and tired of hearing me tell them to get licensed to use their "bubble/blister" pack GMRS/FRS radio they picked up at a local store or retailer. They're at the point where they're just telling me to "take the stick out from my behind" and deal with the fact that the GMRS/FRS radio frequencies will have an growing amount of unlicensed users and thus most if not all unlicensed users won't get caught because it's nearly impossible for the FCC to catch and fine/penalize every single unlicensed user running around with an unlicensed FRS/GRMS "bubble/blister" pack radio on them.

I understand the advantages and benefits that having a license grants me and the responsibilities that it brings, but it appears that most average users who don't use a repeater and that are happy with transmitting unlicensed at 5W or less really don't care about getting a license or want to get one at all. For the most part, all these users care about is that the darned "bubble/blister" pack radio works after they get it home from the store and it lets them communicate with their friends and family who have one on them tuned to the same channel and CTCSS/DCS code.

At the rate that these "blister/bubble" pack radios and their associated unlicensed use are proliferating, should the FCC drop the licensing requirement for GMRS all together if it is shown that the GMRS licensing requirement is truely indeeded unenforcable now?

Lastly, does being a licensed GMRS user require me to report and turn in everyone I know that is an unlicensed "blister/bubble" pack FRS/GMRS radio user to FCC Enforcement?

Respectfully,

--deevader

I say it is hopeless. Come to NYC and listen hear and you will be sickened. Millions of these things loaded with kiddies and a hundred foreign languages most without licenses.
The fcc completely let gmrs users down when they allowed these things to be made. Who is going to pay a few dollars for a "toy" radio that makes beeps and silly tones and then turn around and get an $85 license? It was a bad idea form the outset.
And those with repeaters on the 8 channels have to listen to this garbage all day. Kiddies answering you when you talk on the repeater. The whole thing is down the tubes thanks to someones brilliant idea. I'm sure they could have found 22 channels somewhere else for these things. Sorry to be so negative but I was out here when they didn't exist and now I deal with the results. Regards, Brian.

Hi folks

Unlicenced users are a bane in any country, report non licenced users & keep complaining to your local FCC dept

As licenced GMRS users are you allow to use speech inversion or encryption technology on GMRS channels? nothing to fancy or expensive, that at the very least may stop kids answering back.

Subject: [GMRS] GMRS Licensing Unenforcable?

This is one question I've been asking myself a lot lately. Has the GMRS licensing requirement become unenforcable? I just recently bought a "bubble/blister" pack FRS/GMRS radio and obtained my GMRS license to go with the radio. At certain times as of late, I've been feeling that I've wasted my money to get the license because of the high staturation of unlicensed "bubble/blister" pack radios out in use by the genernal population.

I've discussed and have gotten into many heated arguments regarding this issue with many of my friends and they're sick and tired of hearing me tell them to get licensed to use their "bubble/blister" pack GMRS/FRS radio they picked up at a local store or retailer. They're at the point where they're just telling me to "take the stick out from my behind" and deal with the fact that the GMRS/FRS radio frequencies will have an growing amount of unlicensed users and thus most if not all unlicensed users won't get caught because it's nearly impossible for the FCC to catch and fine/penalize every single unlicensed user running around with an unlicensed FRS/GRMS "bubble/blister" pack radio on them.

I understand the advantages and benefits that having a license grants me and the responsibilities that it brings, but it appears that most average users who don't use a repeater and that are happy with transmitting unlicensed at 5W or less really don't care about getting a license or want to get one at all. For the most part, all these users care about is that the darned "bubble/blister" pack radio works

after they get it home from the store and it lets them communicate with their friends and family who have one on them tuned to the same channel and CTCSS/DCS code.

At the rate that these "blister/bubble" pack radios and their associated unlicensed use are proliferating, should the FCC drop the licensing requirement for GMRS all together if it is shown that the GMRS licensing requirement is truely indeeded unenforcable now?

Lastly, does being a licensed GMRS user require me to report and turn in everyone I know that is an unlicensed "blister/bubble" pack FRS/GMRS radio user to FCC Enforcement?

Respectfully,

--deevader

Hi, Darren - I must say, I am not inclined to be a snitch anyway unless there is a real problem, but if I was, just how would I tell the blister pack GMRS signals from the blister pack FRS signals? They sound the same, and unless you have some intimate knowledge of the radios themselves, even seeing them won't help you much...

In short - it is impossible to reliably report a transgression. It is, however, possible to annoy the heck out of the FCC officials ;-)

Hi Bruce

Just report the un- licenced users on the [GMRS] repeaters. If yr radio abusers are like ours there easy to spot.

Maybe the repeater owner would be the best person to badger the FCC. Better still if the repeater owner stops paying his licence fees [for the repeater] that should get someone attention :-)

Shame the rules do not allow some kind of speech inversion, ironicly would the FCC catch you if you did use it lol.

I'm in the UK, but as a licenced ham operator by our communications regulator OFCOM we have a general duty to report unlicenced users and also any unlawful conduct or behaviour that breechs the Wireless telegraph act.

Plus as I had to study pass a test and pay for me licence so should everyone else lol.

Ps
If a person was using GMRS/FRS sets in the UK I hope someone would as 2 of the freqs clash w/ the Fire Depts On-scene wide area repeater.

Even split tones work, if your HTs and mobiles can do so. Most repeater trespassers listen on the output to scan the tone.. having a different input tone keeps a lot of user out.

DCS works as well as few inexpensive (bubble/blister pack) have DCS.

From: Eric
Topic: 12936 Message: 12936

Hello All:

A new twist. A user here in Providence, Rhode Island has set up a digital repeater on 462.650. It is a Motorola MOTOTRBO□. It uses TDMA technology. The repeater transmits it data "heartbeat" every 90 seconds, twenty four hours a day, at 40 watts. The only ID it transmits is "TRBO TEST" in CW every 10 minutes.

http://business.motorola.com/mototrbo/mototrbo.html

Legal on GMRS?

Start of a trend?

The repeater is located in the vicinity of RI Hospital. It's Fox Hunt time.

Eric

Well, by definition, there are no 'non-standard' CTCSS/DCS codes... but yes, the bubble packs (the very few of them that can do repeater mode at all) usually stick to the 'common 38' CTCSS codes, so you could use one of the others to minimize them being able to key you up.

The more dedicated 'no permission, no use' repeaters will use split tones, with the repeater output tone/dcs code being different from the one required on the input to key it up.

The use of CTCSS tones or DCS doesn't keep strangers out since you're still sharing the same frequency? They're just filters to help filter out the "unwanted" traffic. It doesn't stop someone from same CTCSS tone or DCS setting that you're currently using.

The ability to operate a repeater is included with your GMRS license.
However, I think you need to register your antenna mast if it's
exceeds 6.1 meters (20 feet) above the ground or above the building or
tree on which it is mounted.

A ham repeater and a GMRS repeater are two different things, just as each service is different from the other. I don't think a US operator has to pay a special fee for a repeater once he has his license for the basic GMRS operation. I could be wrong, but I think that's how it works.

For that matter, I don't think a ham repeater counts as a separate licensed station either.

Yahoo group: GMRS (2005 — 2007)
Date: 2007-12-22 13:25:39 UTC
From: John Marcel
Topic: 12924 Message: 12941

As long as the FCC still requires licenses for GMRS use, then there's a legitimacy to attain and maintain a license on the frequency. It's a "Do the Right Thing" situation. In addition, most of the newer Business Bubblepacks DO NOT have the GMRS frequencies, which is somewhat promising. Repeater access (or lack of by bubblepacks) is still a benefit for GMRS licensed users. Outside urban centers, bubblepack interference on repeaters is limited and typically a person-by-person problem and not repeater-wide.

However, there is a real concern over the allowance and continued encroahment by non-licensed users. As said before, urban areas of the US are probably a lost cause. Larger shopping districts are often cluttered by people in the stores and the stores themselves (although many stores are switching to the business bubbles w/out GMRS). There was some discussion before about the GPS capabilities on Rino radios on GMRS frequencies (I believe it was corrected to the FRS/GMRS frequencies only and not the standalone GMRS frequencies). Catalogs like Cabellas and others state that GMRS frequencies are now authorized without license for this use.
So regardless of actual access, the wording further invites non-licensed people on to the GMRS frequencies. The old adage, "DPL = Definitely Prevents Losers" is losing its meaning as more bubblepacks adopt DPL in addition to PL. Add to that non-licensed repeater owners adding to the problem on a level greater than just the kiddies and bubblepack folks.

I guess some of the discussion should ask whether the FCC, the government agency tasked with proper use of the airwaves, is properly enforcing the rules they have set. And furthermore, by way of customer service, is the FCC giving paying customers their moneys worth. My personal opinion is that they ARE NOT. If the FCC wants to continue requiring a for fee license, they either need to increase enforcement of their rules through type acceptance and user enforcement, or greatly reduce the cost of the license to bring it more in line with the appropriate level of non-licensed interference that is likely to occur. $85 for a 5 year license is a ridiculous amount of money to spend for a 5-year license on a band that the FCC themselves are spinning off.

Finally, there are the practices of licensed GMRS users. Some won't be happy with me saying this and I can respect that. But as a licensed user who just parted with $85 I could've used elsewhere more productively, I'll let my kids use the GMRS frequencies when out playing or hiking; so long as there's no one else on the frequency. I use a PL to avoid more serious DPL use and they would never have access to any repeaters. Others will maintain that there should be only between adults, or folks in a more professional or business manner. Some have been strict enough to feel more or less only allow clubs and/or family business can be there. Whatever the opinions are, they're all respectable. The point is licensed people need to have control over the GMRS frequencies in the absence of the FCC. That or start

inundating the FCC w/wav files, compliants, etc so eventually they'll get sick of the aggrivation and do something about their own actions.

I know when my license is up in 2012, I may not re-license. Especially if either the band is completely lost and/or the FCC doesn't act appropriately.

From: kvsp1160@aol.com
Topic: 12924 Message: 12942

Hello group,

In regards to this topic, although it has seemed like it has becomed a major problem and that no one is paying attention, there are several groups and organizations working just on those issues (including mine).

One group in particular is the Personal Radio Association (PRA). They have several members that track illegal users, file detailed reports (location, times, dates, frequencies, tones, other info), and then turn in the reports into the FCC. The FCC will then either send the user a warning or charge the illegal user fines in access of $5,000-10,000 and may also confiscate their equipment. This applies to the Citizens Band, GMRS, Amateur Radio, Business Radio, and other radio services like MURS and LMRS.

You can find more information about the PRA at: http://www.praweb.org/

From there, you can learn about who we are, what we do, who to contact, how to join (become a member - we need your support), FAQ's, and other excellent information.

Just remember, we're listening and watching all the time. If you have a license, use it. If not, pay the consequences. It's that simple. Radio communications can be fun and exciting, but only if you follow the rules that are applied to the radio service.

73 and Merry Christmas!

It doesn't require you to.... but regulations forbid
you from communicating with an unlicensed person.

You most certainly *can* report someone.

Your license gives you the right to totally talk right
over the unlicensed pirates.... they legally do not
exist, since they have no license.... Riley H. said so
himself :)

From: Ray_Vaughan_99
Topic: 12924 Message: 12945

Actually, you are allowed to talk to an FRS user. See the FCC Order below. I do it quite often.

As far as them being secondary to our communications, I'm not so sure about that. Can you cite a rule? We are prohibited from causing interference. While they might not be licensed, they ARE legal.

Before the
FEDERAL COMMUNICATIONS COMMISSION
Washington, D. C. 20554

In the Matter of) WT Docket No. 95-102
) RM-8499
Amendment of Part 95 of the)
Commission's Rules to)
Establish a Very Short Distance)
Two-Way Voice Radio Service)

MEMORANDUM OPINION AND ORDER

Adopted: October 30, 1998 Released: November 9, 1998

By the Commission:

[...]

25. We agree it is very likely that GMRS stations and FRS units, when they hear each other, will communicate with each other. We also believe that allowing GMRS stations and FRS units to exchange messages on the seven channels they share, particularly in emergency situations, furthers our goals of maximizing efficient use of the radio spectrum and promoting public safety. However, we find it unnecessary to amend the rules as Trahos suggests. The rules to which Trahos cites as prohibiting GMRS stations from communicating with FRS units do not apply to the classes of GMRS land stations that are authorized to transmit on channels that are shared with FRS units. GMRS stations, which are authorized by rule to share the 462 MHz interstitial channels with FRS units, are mobile stations and small base stations transmitting voice type emissions with relatively low power. Typically, these stations are transmitting the same type of communications as FRS units. The rules already permit GMRS station operators to transmit the same messages as FRS units and GMRS stations are not prohibited from communicating with FRS units. Nevertheless, we clarify, that GMRS and FRS units operating on the same frequencies may communicate with each other if the individual operators so choose.

From: kevin asato
Topic: 12924 Message: 12947

Forgive my ignorance as I have not looked it up in the rules - _register_ with whom?

FAA regs don't care about tower height until it goes over 200 feet or within so many thousands of feet from a runway. They also set requirements for tower markings and lighting at that point and include you in the aero charts. Owners of repeater sites take care of this. Local regulations may also regulate tower height.

As I understand things, repeater coordination (what I think of as registration)is an adhoc effort at best as no one GMRS repeater is allowed to camp out on a frequency pair as in Amateur Radio.

I realize you were a bit unsure in making the statement. I just trying to understand the nature of what was written for my education.

Here's the starting point:

http://wireless.fcc.gov/antenna/index.htm?job=home

If you're anywhere near an airport, the 200' rule doesn't apply.

This page can tell you if you need to register a smaller tower and how
tall it can be.

http://wireless2.fcc.gov/UlsApp/AsrSearch/towairSearch.jsp

From: A10382
Topic: 12924 Message: 12949

The FAA does not require antenna notification unless it is 200' or greater above terrain (this is done to insure the antenna is noted on aeronautical charts)
- OR - and this is a BIG or:
If the tower protrudes into the protected profile of an approach or departure route (or 10 degrees either side of the approach/departure path line). For instrument departure routes, the FAA establishes minimum climb gradients (in feet per mile) to insure aircraft clear the terrain.
For approaches, the FAA sets the approach path, and depicts it visually on the instrument approach plate.
For those in line with runways for visual approaches, the FAA can check for you if your tower will produce a hazard.

If your tower is already erected and poses a hazard, you WILL have to either take it down or shorten it to the extent the FAA determines that the hazard will be eliminated

If you are within 2 miles of an airport - and particularly if you are even approximately aligned with any of the runways, it is best to contact the FAA FSDO (Flight Safety District Office) that serves your area. They can be found in the 'blue pages' of your phone book.

The FAA regs are not just for towers,, they also include all man made structures. Recently, a developer in San Diego was forced to remove the upper floors from a new office complex that was nearing it's completion. The developer had failed, even before construction began, to comply with the FAA's orders to change the design. The developer was banking on the fact that because he had an approved building permit form the city, he was not subject to the FAA regs. I believe his attorney had refused to continue any work for him after the developer received, and refusing to comply with, the original FAA notice to change the design and shorten the building. Cost to the developer to remove the upper floors was estimated at over 50 million... OUCH!
This exact same thing happened about 14 years ago with the developer of a parking structure near the same airport (Montgomery Field). The landing gear on arriving flights was clearing the building by a less than 100'. First time Roof-Top parkers would sometimes get a noisy surprise (more like a heart-stopping surprise) as a large jet aircraft, landing gear and flaps extended sailed over their heads !

Most on this list seem to want to apply the same kind of culture to GMRS/FRS that exists in Ham Radio. That just isn't going to happen now that these bubble pack radios are so prolific.
I feel for you folks in the big metro areas because it sounds like the band is overcrowded and lost. WE don't have it too bad here in Florida. Though I'm sure that come Christmas morning, things will be quite lively on the 462 band.

Merry Christmas to all of you!

Hi folks

Thank for answering my questions. Got a few more lol

Who or what entity is the GMRS service (inc the repeater function) for? Our PMR446 service (similar to your FRS) is for short range business comms, why was the licenced GMRS part added, if longer range is required wouldn't MURS be an better option?

Is there a legal limit to the power output of a GMRS repeater?

Can multiple GMRS repeaters be linked, ie could the output from 1 repeater be matched to the input of another 1 thus extending range even further?

Can any type of speech be broadcast over a GMRS repeater ie a local net w/friends etc?

73 to everyone and have a happy christmas.

Kids are smart ! Smart enough to figure out that you can use 2 bubble pack radios (one to transmit on the input and the other to receive on the output).

My 9 year old grandson and his next door buddy did exactly that for an unused ambulance company repeater that, despite being inactive for a few years, is still on the air.

The ambulance company switched to the county's combined Fire/EMS dispatch system about 2 years ago, but the repeater which was privately owned is still up and running - covering almost a 40 mile radius.

gmrs was around way before they ruined it by adding the 8 gmrs channels to the toy walkie talkies that have both gmrs and the 14 frs channels.
You can run up to 50 watts on gmrs.
Whether or not gmrs repeaters can be linked has been debated for years! There is no FCC rule prohibiting it per se.
MURS is probably better for 2 portables talking to each other directly. There are no MURS repeaters.
gmrs has been around for many years with all kinds of chat going on.
There were many businesses on in the older days but they are not allowed to get new licenses so there are very few grandfathered in.
gmrs has families, friends, firemen and groups like REACT around for the 13 years that I have been on although I go for long periods of inactivity which is a needed break from all the stuff going on.
Merry Christmas to you also!

Sec. 95.1 The General Mobile Radio Service (GMRS).
Source: 48 FR 35237, Aug. 3, 1983, unless otherwise noted.
(a) The GMRS is a land mobile radio service available to persons for short-distance two-way communications to facilitate the activities of licensees and their immediate family members. Each licensee manages a system consisting of one or more stations.

> Is there a legal limit to the power output of a GMRS repeater?

Sec. 95.135 Maximum authorized transmitting power.
(a) No station may transmit with more than 50 watts output power.
Base stations and repeaters are limited to 50W

There are other restriction of a 5W limit for the 'interstitals' (the 7 frequencies shared with FRS).
The mention of a 'small base station' is not longer applicable.

> Can multiple GMRS repeaters be linked, ie could the output from 1 repeater be matched to
> the input of another 1 thus extending range even further?

Doing so would make it difficult to impossible to adherre to the regulation that requires you to monitor
the outputs in their locales to be sure you could yield to any emergency traffis as well as not interfere
(i.e.; avoid 'stepping on') a local conversation already in place.

>
> Can any type of speech be broadcast over a GMRS repeater ie a local net w/friends etc?
Permitted and prohibited transmissions are noted in Rule 95.181 and 95.183 respectively.
See: http://www.access.gpo.gov/nara/cfr/waisidx_06/47cfr95_06.html

There may be other notes of permitted and prohibited connunications scattered in both other paragraphs and other sections...

The 'secret' to correctly reading the FCC regs (as well as those of the IRS, FAA, etc.) is to avoid stopping
when you find what you want to hear. What one section gives, another may take away!
Federal regs are generally though of as part of the "Attorny's Full Employment Act" (AFEA) of 1776.

Please provide evidence showing successful enforcement of the rules and regulations that have resulted in user fines in excess of $5000 and/or confiscation of their radio equipment by the FCC as claimed for GMRS licensing violations.

Has the PRA pushed for legistlation or changes to the rules that govern sales of GMRS (enabled) equipment that would require the retailer to verify that the purchaser is covered by or holds a valid

GMRS license? It would be similar to a background check at a gun shop when you apply to purchase a gun. For example, if the retalier fails to check or makes a sale to an unlicensed individual, they would be subject and liable to a large substantial monetary fine per infraction etc. This example would make sense because a retailer has significantly more at stake than your average John Doe bubble pack GMRS radio user does and would allow easy auditing of the resulting usage from sales. Why not just address the issue at the distribution point instead of chasing after the millions upon millons of bubble pack users out there in the world? It would definitely raise the awareness of the requirement to have a GMRS license to operate the equipment that many in the PRA seems to seek and increase the number of licensed GMRS users out there.

YES, completely.

> I've discussed and have gotten into many heated arguments regarding
> this issue with many of my friends and they're sick and tired of
> hearing me tell them to get licensed

Maybe you should take that as a clue. Less than 0.001% of GMRS bubble
pack users are licensed and that is not going to change.

> Lastly, does being a licensed GMRS user require me to report and
turn in everyone I know that is an unlicensed "blister/bubble" pack
> FRS/GMRS radio user to FCC Enforcement?

Don't bother. You'll be wasting your time. Better to write down the
registration numbers of people you see speeding or running stop signs.
There is a far greater likelihood that you can get results on that.

That's bizarre, since bubble pack radios do not transmit on the repeater input frequencies. They DO transmit on the outputs and they do transmit on interstitals between the inputs, so if what you described above really did happen, the repeater receive bandwidth on the input must be too wide or out of alignment.

Topic: 12924 Message: 12960

What makes no sense to me, and I'll explain why in a minute, is that the FCC stuck FRS & GMRS frequencies next to each other (intermingled).

A simple logistical issue that happened here in Massachusetts back a few years ago is this:

I was part of a local fire buff net that operated off a GMRS repeater system on 462.575 on a high hill. It was on a good hill and gave very good mobile coverage. Each user was required to hold a FCC GMRS license and when you accounce an incident, you then lastly identify yourself w/ your FCC call sign. All completely legit.

Until.. one day, and then constant for a week and then weeks, a bunch of kids who most likely got bubble packs (or FRS portables) started chatting all day long back & forth (this was during summer) on FRS channel 8 (467.5625) with PL 100.0 (example only).

Well that PL tone was also the PL tone for this fire buff net on this GMRS repeater {input & output} (I think it had a few other PL tones in it) and when the kids would talk on FRS channel 8 (perfectly legit) it would bleed into the rptr's input (which is GMRS 467.575). FRS & this GMRS rptr are not narrowband, so chatting on FRS ch 8 does in fact bleed over onto GMRS 467.575. With that said, the kids chatting all day long would constantly key up the GMRS rptr, drive us all crazy but what could anyone do? So everytime the kids talk, it re-broadcasts it through our GMRS rptr for as long as could be - all day long.

So thank you to the (not so "genius") who crammed FRS & GMRS frequencies together and then make a hand-held portable that does FRS/GMRS in one. If parents buy these for their kids, do you think that mom & dad are going to explain to their kids "Well son, if you talk on channels 1 to 14, your fine, but if you talk on channels 15 to 25, then you need to see me and we need to go on the internet and buy a GMRS license. And then ID your call sign every so often, etc." NO.. the kids will put it on any channel they can figure out and talk all over the frequency band!

Here is the frequency chart & you can see how screwed up things are:

462.550 GMRS Rptr output
462.5625 FRS Ch 1
462.575 GMRS Rptr output
462.5875 FRS Ch 2
462.600 GMRS Rptr output
462.6125 FRS Ch 3

462.625 GMRS Rptr output
462.6375 FRS Ch 4
462.650 GMRS Rptr output
462.6625 FRS Ch 5
462.675 GMRS Rptr output
462.6875 FRS Ch 6
462.700 GMRS Rptr output
462.7125 FRS Ch 7

467.550 GMRS Rptr input
467.5625 FRS Ch 8
467.575 GMRS Rptr input
467.5875 FRS Ch 9
467.600 GMRS Rptr input
467.6125 FRS Ch 10
467.625 GMRS Rptr input
467.6375 FRS Ch 11
467.650 GMRS Rptr input
467.6625 FRS Ch 12
467.675 GMRS Rptr input
467.6875 FRS CH 13
467.700 GMRS Rptr input
467.7125 FRS Ch 14
467.725 GMRS Rptr input

I hope this helps to better understand why it's very tough to enforce GMRS. The FCC did this and now illegal activity with & into GMRS frequencies is almost impossible to track problems.

12961. Thanks

Someone please enlighten me ... where is it written into stone that
certain freqs can only be used as repeater inputs & outputs? Aren't
we (licensed operators) authorized to use ANY of the "un-

bubblepacked" freqs for two-way on simplex?

12963. FCC rules on Repeater in/out freqs

Yahoo group: GMRS (2005 — 2007)
Date: 2007-12-27 17:48:16 UTC
From: Walters
Topic: 12963 Message: 12963

Hi There omnisound_radio,

In Part 95 of the FCC rules, it is spelled out quite clearly which freqs are for repeater input (95.29(b). This leaves the rest are for repeater output and simplex use (95.29(a). The use of the term "duplex mode" constitutes operation through a repeater. Then we find the "interstitial" or in between freqs that make up the "shared" 7 for GMRS/FRS simplex use. The table created by cmpsa1 was designed to show this interleaving of FRS freqs woven into the GMRS freqs. Especially note that the FRS "only" channels (usually 8-14) are indeed interstitial freqs in the repeater input range of GMRS. It is a real shoehorn job. I have not experienced any bleed over as described but certainly could see it happening when stations are in close proximity or out of spec or even running in wide vs narrow band in the wrong configuration somehow. I guess a poorly designed radio or one not FCC type accepted could "splatter" all over and take out the GMRS freq above and below it if on one of the interstitials. Hope this helps.

Stan WQFD736

95.7 Channel sharing.

(a) Channels or channel pairs (one 462 MHz frequency listed in 95.29(a) of this part and one 467 MHz frequency listed in 95.29(b) of this part) are available to GMRS systems only on a shared basis and will not be assigned for the exclusive use of any licensee. All station operators and GMRS system licensees must cooperate in the selection and use of channels to reduce interference and to make the most effective use of the facilities.

95.29 Channels available.

(a) For a base station, fixed station, mobile station, or repeater station (a GMRS station that simultaneously retransmits the transmission of another GMRS station on a different channel or channels), the licensee of the GMRS system must select the transmitting channels or channel pairs (see para. 95.7(a) of this part) for the stations in the GMRS system from the following 462 MHz channels:

462.550, 462.5750, 462.6000, 462.6250, 462.6500, 462.6750, 462.7000 and 462.7250.

(b) For a mobile station, control station, or fixed station operated in the duplex mode, the following 467 MHz channels may be used only to transmit communications through a repeater station and for remotely controlling a repeater station. The licensee of the GMRS system must select the transmitting channels or channel pairs (see para. 95.7(a) of this part) for the stations operated in the duplex mode, from the following 467 MHz channels:

467.5500, 467.5750, 467.6000, 467.6250, 467.6500, 467.6750,
467.7000, and 467.7250.

(c) [Reserved.]

(d) [Reserved.]

(e) [Reserved.]

(f) Except for a GMRS system licensed to a non-individual, a mobile station
or a small base station operating in the simplex mode may transmit on
the following 462 MHz interstitial channels:

462.5625 462.5875 462.6125 462.6375 462.6625 462.6875 and 462.7125.

These channels may be used only under the following conditions:

(1) Only voice type emissions may be transmitted;

(2) The station does not transmit one-way pages; and

(3) The station transmits with no more than 5 watts ERP.

Try coming to The Bronx in NYC and the surrounding counties. You have
loads of Spanish guys running Motorola gear with wide band bleeding
over on the gmrs output channels and bleeding over the gmrs input
channels !!!! You can even see there mdc IDs coming through to the
gmrs channels.
They curse and play music all day like DJs.

I LOVE my Ritron SLX-400.
It is very small, yet tough and powerful. It will do split tones for TX and RX, also talkaround, scan, DTMF, squelch, etc., right from the front panel.

The drawbacks are it's a bit pricey. Also, frequencies cannot be programmed from the radio, and the programming software was ungodly expensive! More than many radios cost. Yes, I did unfortunately buy it just to program my one radio.

I believe that the only way to fix this, if it can be fixed at all, is to sue the FCC over the requirement and cost to obtain a license for a service that is not being regulated and has, for the most part, been abandoned for enforcement action.

The concept is simple, to win a civil case you must show how there action, or in this case inaction, has caused you harm and/or money. Both are present, I am out my $85 for a license to a service that I can not use because it has deteriorated to a point of chaos due in most part by:

a) The FCC allowing the manufacture and sale of inexpensive radios capable of operating in two services, one of which is a licensed service and the other that is not.

b) The lack of FCC enforcement action against retailers who have sold and continue to sell radios to a licensed service without an advisement or warning label on advertisements and packaging. The FCC was very successful in this endeavor during the 1990's against Radio Shack and other retailers that sold low-cost 2M and 440Mhz HAM radios (HTs). The catalogs and newspapers always stated the FCC requirement for a license below the ad.

c) The lack of FCC enforcement action against unlicensed operators.

I know that none of the above is realistic today, but thats my point. Because the FCC has allowed this service to basically become an unofficial unlicensed service, but continues to collect the licensing fee's and issue worthless licenses to the GMRS service they are at best legally complacent and at worst committing fraud. Either way we win because if their defense is that it is impossible to enforce the GMRS license requirement then they should not continue to collect the license fee and issue licenses.

This same thing happened to Citizens Band Radio in 1975. Because they could not enforce unlicensed operations they did away with the license requirement. What a shame, the CB band was really something back then before the big CB boom.

If bubblepackers are interfering with a GMRS repeater why not just ignore them and talk over the top. 50 watts should blast them unless there real close to the Rx'ing station. IF they decide to complain (fat chance) to the FCC they automatically lose by not being licensed.
We have to monitor before we talk. If we hear crap can't we just assume its static and blast over them. "Thats all I heard Mr FCC - just static"!!!
If thems not licensed then thems signals don't exist, right???

This is NOT a sales pitch as I am a dealer fir ICOM.

For a bottom tier radio I like the F21GM. Has all the GMRS channels and needs no software to program. Works repeaters but not cross tones. I sell them locally for 130.00.

My personal favorite is the F-21. Feels right in my hand, Li-ion Battery but needs software and cable to program. As a dealer I do this for free for my customers as needed. A bit spendier tho at around 300.00.

For GMRS the higher end radios just seem to pricey for what we can use in the GM service. They go from about 500 to almost 2K bucks

A neat idea. The way to handle this is a "Class Action Suit" with hundreds of us joining
in to pay the legal fees (say $10 to $20 each???) and all file our complaints as individual
licensee's or what ever the lawyers tell us to do.

Just a thought,

August

I also like the F21GM. If someone were to consider a used radio I recommend a Motorola HT1000. It is certified for use on GMRS and it is LOUD! It definitely has all the rest beat when it comes to audio. My CERT team (Community Emergency Response Team) uses HT1000's purchased on EBay for about 150.00 each. The programming cable was 20 dollars. During an emergency there is usually a tremendous amount of noise. We looked for a reliable work horse that could be heard over the "Din". The HT1000 fit our needs very well.

From: Rocky
Topic: 12973 Message: 12973

I have been looking at the regs and can't find a direct answer to this.....

If my repeater uses for example 462.550 for its output, where is it written that I MUST use 467.550 as the input?

I found references to channel pairs as "1 from the 462 channels and 1 from the 467 channels" but nowhere specifically as to a 5 mhz offset.

Could this be a way to keep the kids guessing?

Just wondering

This is NOT a sales pitch as I am a dealer fir ICOM.

For a bottom tier radio I like the F21GM. Has all the GMRS channels and needs no software to program. Works repeaters but not cross tones. I sell them locally for 130.00.

My personal favorite is the F-21. Feels right in my hand, Li-ion Battery but needs software and cable to program. As a dealer I do this for free for my customers as needed. A bit spendier tho at around 300.00.

For GMRS the higher end radios just seem to pricey for what we can use in the GM service. They go from about 500 to almost 2K bucks

In practice, how would you monitor the channel for other users?

Say your repeater is set up for A in and B out. When you transmit on A, you wouldn't know if you're about to step on a transmission on A since you're busy monitoring B.

I haven't checked for Part 95 approval, but the Motorola Saber may be the best handheld ever made. More audio than any radio today, rock solid, and feels best in the hand. You can find them dirt cheap on the used market now because they can't do narrow band. I also have HT1000's and HT600 (very similar) but the Saber is even better.

Topic: 12961 Message: 12977

Many GMRS repeaters use different CTCSS/DCS tones on the input and output frequencies, either to seperate different user groups, or to prevent casual use by unlicensed users, or both.

That is, to get the repeater to key up, you must transmit with one CTCSS tone, but the output transmits a different CTCSS tone. It might also be transmit a DCS code, but receive a CTCSS tone. To use these repeaters, you need to be able to set seperate transmit and receive tones on a channel.

The F21GM cannot do this 'by hand', but if you have the programming software, and know how to use it with this radio (there's a trick to it, you must put the programming software in 'Manufacture' mode), you can indeed program an F21GM for split tones.

From: Craig
Topic: 12924 Message: 12978

Mostly agree with Rocky. I have had a paid

GMRS license for many years. Yes I hear

the un-licensed users. Very annoying but

certainly not a problem with the repeater.

I guess with some of the thinking by you

folks, if you only drove a car a mile a

week, you wouldn't need a license?

Just do the right thing, get a license and

do the best you can and encourage

others to do the same and enjoy. Also

Rocky, a little strange. Your business

and ham license is registered to a

'William' in Grants Pass, OR. The GMRS

license is registered to a 'Sam' in Kenosha,

WI. Yes strange to say the least?????

I will put my two cents in, I like the F21GM also for the price and what you get. It is adequte for most GMRSers needs. I found battery eliminators and speaker mics easy to find and although a little bit trickier, the antenna adapter to connect to a BNC makes the unit suitable as a small base, fixed station or low power mobile.

I also like the F21GM. If someone were to consider a used radio I recommend a Motorola HT1000. It is certified for use on GMRS and it is LOUD! It definitely has all the rest beat when it comes to audio. My CERT team (Community Emergency Response Team) uses HT1000's purchased on EBay for about 150.00 each. The programming cable was 20 dollars. During an emergency there is usually a tremendous amount of noise. We looked for a reliable work horse that could be heard over the "Din". The HT1000 fit our needs very well.

12980. Cross-Tone

Yahoo group: GMRS (2005 — 2007)
Date: 2007-12-31 19:22:23 UTC
From: Ray_Vaughan_99
Topic: 12961 Message: 12980

One trick I've seen used to find an 'available' PL or DPL is to use one of these on a receiver:

http://www.com-spec.com/tp3200.htm

Gather a few days of data and you'll find an available input DPL or PL is in use by others. At the end you'll have a log with all the possible PLs and DPLs with a count of hits. Could help minimize false keyups later. Might be good to monitor a while to cover times where there may be ducting.

Repeat the same test with a receiver tuned to the repeater output to make sure the one you pick won't be opened up in your user radios by another nearby system. Also important if someone else is already doing cross-tones.

Of course, there's nothing to stop someone else from coming up on the air with your tones the day after you find the perfect set.

When you're all done, this same device could be the brains for your system. It does do cross-tone.

If you do decide to go cross-tone, be aware that it will rule out some radios for your system. At best they might be able to do carrier squelch RX and tone TX. With some older radios the RX PL was assumed to be the TX PL. The good news is that it will rule out many modified ham radios that aren't type accepted for GMRS. Going DPL instead of PL on the input will rule out many ham rigs also.

The HT1000's can do wide and narrow which is necessary for the GMRS repeater channels.

A neat idea. The way to handle this is a "Class Action Suit" with
hundreds of us joining
in to pay the legal fees (say $10 to $20 each???) and all file our
complaints as individual
licensee's or what ever the lawyers tell us to do.

Just a thought,

August

ICOM does not have any program software for the F21GM. At least none that I can find.
Rocky
